Nirvana (nir-vā'nā), *n.* [Skt., blowing out (as of a light), extinction, < *nīs*, out, + *vāna*, blowing, < *√vā*, blow, with abstr. noun-suffix *-ana*.] In *Buddhism*, the condition of a Buddha; the state to which the Buddhist saint is to aspire as the highest aim and highest good. Originally, doubtless, this was extinction of existence, Buddha's attempt being to show the way of escape from the miseries inseparably attached to life, and especially to life everlastingly renewed by transmigration, as held in India. But in later times this negation has naturally taken on other forms, and is explained as extinction of desire, passion, unrest, etc.

What then is *Nirvana*, which means simply going out, extinction; it being quite clear, from what has gone before, that this cannot be the extinction of a soul? It is the extinction of that sinful, grasping condition of mind and heart which would otherwise, according to the great mystery of Karma, be the cause of renewed individual existence. That extinction is to be brought about by, and runs parallel with, the growth of the opposite condition of mind and heart; and it is complete when that opposite condition of mind and heart is reached. *Nirvana* is therefore the same thing as a sinless, calm state of mind; and, if translated at all, may best, perhaps, be rendered holiness—holiness, that is, in the Buddhist sense, perfect peace, goodness, and wisdom. *Rhys Davids*.

Buddhism does not acknowledge the existence of a soul as a thing distinct from the parts and powers of man which are dissolved at death, and the *Nirvana* of Buddhism is simply Extinction. *Encyc. Brit.*, IV. 334.

niter, **nitre** (ni'tēr), *n.* [*<* F. *nitre* = Sp. It is formed in the soil from nitrogenous organic bodies by the action of microbes, and crystallizes upon the surface in several parts of the world, and especially in the East Indies. In some localities where the conditions are favorable it is prepared artificially from a mixture of common mold, or porous calcareous earth containing potash, with animal and vegetable remains containing nitrogen. Under proper conditions of heat and moisture the nitrogen of the decaying organic matter is oxidized to nitric acid, which combines with potash and lime, forming niter and calcium nitrate. This is afterward dissolved in water and purified. At present it is chiefly prepared from sodium nitrate and potassium chlorid by double decomposition. It is a colorless salt, with a saline taste, and crystallizes in six-sided prisms. It is used somewhat as an antiseptic and as an oxidizing agent, but its most common use in the arts is in the making of gunpowder; it also enters into the composition of fluxes, is extensively employed in metallurgy, and is used in dyeing. In medicine it is prescribed as diaphoretic and diuretic. The substance called *niter* by the ancients was not potassium nitrate, but either sodium carbonate, more or less mixed with salt and other impurities, or potassium carbonate, chiefly the former, since niter is usually spoken of as having been obtained from the beds of salt lakes, where the alkali must have been soda, this being a mode of occurrence peculiar to soda and not to potash. But the niter which the ancients speak of as having been obtained by leaching wood-ashes was more or less pure potassium carbonate. It was not until the early part of the eighteenth century that soda and potash began to be clearly recognized as distinct substances; and it was considerably later in the century before the chemical relations of the two alkalis were understood. See *salt-peter*, *soda*, and *potash*.—**Cubic niter**. Same as *sodium nitrate*.—**Sweet spirit of niter**. See *spirit of nitrous ether*, under *nitrous*.

Same as *nitroglycerin*.—**Nitrate of potash, niter**.—**Nitrate of silver**, silver oxidized and dissolved by nitric acid diluted with two or three times its weight of water, forming a solution which yields transparent tabular crystals on cooling, these crystals constituting the ordinary commercial silver nitrate. It is sometimes employed for giving a black color to the hair, and is the basis of the indelible ink used for marking linen. It is also very largely used in photography. Also called *argentic nitrate*.—**Nitrate of soda**, sodium nitrate, a salt analogous in its chemical properties to potassium nitrate or niter. It commonly crystallizes in obtuse rhombohedrons. See *nitrous*.—**Nitric acid**, HNO₃, an acid prepared by distilling a mixture of sulphuric acid and sodium nitrate. When pure it is a colorless liquid, but it is usually yellowish, owing to a small admixture of oxides of nitrogen. Its smell is very strong and disagreeable, and it is intensely acid. It is employed in etching on steel or copper; as a solvent of tin to form with that metal a mordant for some of the finest dyes; in metallurgy and assaying; also in medicine, in a diluted state, as a tonic, and in affections of the alimentary tract and of the liver; and in concentrated form as a caustic. 2. Not so; nay; not; with implied, but not expressed, repetition of a preceding (or succeeding) statement denied or question answered in the negative, with change of person if necessary. This is practically equivalent to a complete sentence with its affirmation denied; as, "Was he here yesterday?" "No" that is, "he was not here yesterday." It is therefore the negative categoric particle, equivalent to *nay*, and opposed to *yes* or *yea*, the affirmative categoric particles. The fine distinction alleged to have formerly existed between *no* and *nay*, according to which *no* answered questions negatively framed, as, "Will he not come?" *No*, while *nay* answered those not including a negative, as, "Will he come?" *Nay*, is hardly borne out by the records. *No* and *nay* are ultimately identical in origin, and their differences of use (*nay* being restricted in use and *no* now largely superseded by *not*) are accidental. (a) In answer to a question, whether by another person or asked (in echo or argument) by one's self.

3. Not; used after *or*, at the end of a sentence or clause, as the representative of an independent negative sentence or clause, the first clause being often introduced by *whether* or *if*; as, he is uncertain *whether* to accept it *or no*; he may take it *or no*, as he pleases.

2. Social or political preëminence, usually accompanied by special hereditary privileges, founded on hereditary succession or descent; eminence or dignity derived by inheritance from illustrious ancestors, or specially conferred by sovereign authority. The Constitution of the United States provides (art. 1, sec. ix.): "No title of nobility shall be granted by the United States."

Lacon, *Nobility*.

Nobility without an estate is as ridiculous as gold lace on a frieze coat.
Sheridan, *The Duenna*, ii. 3.

The great peculiarity of the baronial estate in England as compared with the continent is the absence of the idea of caste: the English lords do not answer to the nobles of France or to the princes and counts of Germany, because in our system the theory of nobility of blood as conveying

political privilege has no legal recognition. English nobility is merely the nobility of the hereditary counsellors of the crown, the right to give counsel being involved at one time in the tenure of land, at another in the fact of summons, at another in the terms of a patent; it is the result rather than the cause of peerage. The nobleman is the person who for his life holds the hereditary office denoted or implied by his title. The law gives to his children and kinsmen no privilege which it does not give to the ordinary freeman, unless we regard certain acts of courtesy, which the law has recognised, as implying privilege. Such legal nobility does not of course preclude the existence of real nobility, socially privileged and defined by ancient purity of descent or even by connexion with the legal nobility of the peerage; but the English law does not regard the man of most ancient and purest descent as entitled thereby to any right or privilege which is not shared by every freeman. . . . Nobility of blood—that is, nobility which was shared by the whole kin alike—was a very ancient principle among the Germans, and was clearly recognized by the Anglo-Saxons in the common institution of wergild.
Stubbs, *Const. Hist.*, § 188.

In England there is no nobility. The so-called noble family is not noble in the continental sense; privilege does not go on from generation to generation; titles and precedence are lost in the second or third generation.
E. A. Freeman, *Amer. Lects.*, p. 306.

3. A body of persons enjoying the privileges of nobility. Specifically—(a) In Great Britain and Ireland, the body of persons holding titles in virtue of which they are members of the peerage. See *peerage*; see also quotations from Stubbs and Freeman under def. 2. (b) In some European countries, as in Russia, a class holding a high rank and enjoying, besides social distinction, special privileges; the noblesse. = Syn. 1. Nobility, Nobleness, elevation, loftiness, dignity. In application to things nobleness is rather more appropriate than nobility, as the nobleness of architecture or one's English, while nobility is more likely to be applied to persons and their belongings, as nobility of character or of rank; but this distinction is no more than a tendency as yet. See *noble*.

(e) Precious; valuable: applied to those metals which are not altered on exposure to the air, or which do not easily rust, and which are much scarcer and more valuable than the so-called useful metals. With *generous* the idea of liberality in giving has somewhat overshadowed the earlier meaning, that of a noble nature and a free, warm heart going forth toward others: as, a generous foe disdains to take an unfair advantage. *Magnanimous* comes nearer to the meaning of *noble*; it notes or describes that largeness of mind that has breadth enough and height enough to take in large views, broad sympathies, exalted standards, etc. (See definition of *magnanimity*.) It generally implies superiority of position: as, a nation so great as the United States or Great Britain can afford to be *magnanimous* in its treatment of injuries or affronts from nations comparatively weak.

2. An old English gold coin, current for 6s. 8d., first minted by Edward III., and afterward by Richard II., Henry IV., V., and VI., and also by Edward IV., under whom one variety of the noble was called the *ryal* or *rose noble* (see *ryal*).

The obverse type of all these nobles was the king in a ship. The reverse inscription, "Jensu antem transiens per medium florum illat" (Luke iv. 30), was probably a charm against thieves. Ruding conjectures, though not with much probability, that the coins derived their name from the noble nature of the metal of which they were composed. The coin was much imitated in the Low Countries. See *George-noble*, *quarter-noble*.

(b) In *entom.*, a genus of moths established by Fabricius in 1776. It gives name to the family *Noctuidæ* and to many corresponding groups of lepidopterous insects, with which it has been considered continuous, though the old *Noctua* or *Noctuides* have been divided into no fewer than twenty-two families by some writers. The name is now restricted to moths having the following technical characters: antennæ with very short cilia, rarely demipennate in the male, simple and filiform in the female; palpi little ascending, with long second and very short third joint; thorax hairy, subquadrate, with rounded, not very distinct collar; abdomen smooth, a little depressed, ending in a tuft cut squarely in the male, obtusely cylindrical in the female; upper wings entire, obtuse at tip, slightly glistening with spots always distinct; and legs strong, moderately clothed, with the feet almost always spinulose. The larvæ are thick and cylindrical, a little swollen behind, with a globular head of moderate size. They live upon low plants, and hide during the day under brush and dry leaves. They hibernæte, and pupate in the spring underground without spinning any silk. Nine subgenera of *Noctua* as thus defined are recognized by Guenée, all erected into genera by many other authors. The genus *Noctua* in this sense is represented in Europe and America. (c) In *ornith.*, a genus of owls named by Savigny in 1809. In *geom.*: (a) A point upon a curve such that any line passing through it cuts the curve at fewer distinct points than lines in general do. At a node a curve has two or more distinct tangents. If two of these are real, the curve appears to cross itself at this point; if they are all imaginary, the point is isolated from the rest of the real part of the curve. (b) A double point of a surface; a point where there is more than one tangent-plane; especially, a conical point where the form of the surface in the infinitesimally distant neighborhood is that of a double cone of any order. But there are other kinds of nodes of surfaces, as *trinodes*, *binodes*, and *unodes* (see these words), as well as nodal curves. See *nodal*. nominalism (nom'i-nal-izm), n. [= F. nominalisme; as nominal + -ism.] The doctrine that nothing is general but names; more specifically, the doctrine that common nouns, as man, horse, represent in their generality nothing in the real things, but are mere conveniences for speaking of many things at once, or at most necessities of human thought; individualism. Medieval thinkers, especially those of the twelfth century, are classified as being either nominalists or realists; modern philosophers have generally joined in the condemnation of medieval realism, but have nevertheless been mostly rather realists than nominalists. The following are the most important varieties of nominalism: (a) That of the Stoics, who held that the only sort of thing that is not universal, and indeed the only sort that is not corporeal, is the meaning of a word (Gr. λεκτόν, L. dictio) as something different from the actual thought and distinct for each language. (b) That of Roscellin, condemned by the Church in 1092, which, though regarded as novel doctrine by his contemporaries, so that he has often been called the inventor of nominalism, had in substance been taught for two hundred years without attracting any particular attention. His views, so far as we can gather them from the reports of malicious adversaries, in the light of other nominalistic texts, were as follows. Various relations, usually considered as real, such as the relation of a wall to a house as a part of it, have no existence in the things themselves, but are due to the way we think about the things. Colors are nothing over and above the colored bodies. He held that nothing exists but individuals, and according to St. Anselm was "buried in corporal images." His opinion concerning universals was not called nominalism, but the sententia reorum, or realism. Anselm states that he held universals to be nothing but the breath of the voice (flatus vocis). This statement should not be hastily put aside as an enemy's misrepresentation, for the authorities agree that he made universals to be, not words, but vocal sounds; and since the breath was in his time and loog after hardly regarded as a material thing, he may quite probably have been so "buried in corporal images" as to have confounded the breath of the voice with an incorporeal form, which agrees with a report that he was a follower of the pantheist

Scotus Erigena. (c) That of Peter Abelard (born 1079, died 1142), which consisted in holding that universality resides only in judgments or predications. Yet he not only admits that general propositions may be true of real things by virtue of the similarities of the latter, but also holds to a Platonist doctrine of ideas. Various other kinds of nominalism are allied to that of Abelard, especially the vague modern doctrine called *conceptualism* (which see). (d) The terminology of the "Venerable Inceptor," William of Occam (lived in the fourteenth century), who held that nothing except individuals exists, whether in or out of the mind, but that concepts (whether existing substantively or only objectively in the mind he does not decide) are natural signs of many things, and in that sense are universal. (e) That of Thomas Hobbes of Malmesbury (born 1588, died 1679), who added to the doctrine of Occam that there are no general concepts, but only images, so that the only universality lies in the association of ideas. This doctrine, followed by Berkeley, Hume, James Mill, and others, is specifically known as *nominalism* in modern English philosophy, as contradistinguished from *conceptualism*. (f) That of modern science, which merely denies the validity of the "substantial forms" of the schoolmen, or abstractions not based on any inductive inquiry; but which, far from regarding the uniformities of nature as mere fortuitous similarities between individual events, maintains that they extend beyond the region of observed facts. Properly speaking, this is not nominalism. (g) That of Kant, who maintained that all unity in thought depends upon the nature of the human mind, not belonging to the thing in itself.

Dr. Sancroft, Archbishop of Canterbury, six bishops (among them Bishop Ken), and about four hundred other clergymen were deprived of their sees and livings by the new civil authority, and others put in their places. An episcopal succession was kept up by the nonjurors in both England and Scotland, but their numbers rapidly diminished, and their last bishop died in 1805. Part of the nonjuring bishops retained the use of the Prayer-book of 1662, others restored the communion office of 1549, and afterward (in 1718) introduced one founded on this, but largely conformed to primitive and Oriental liturgies. This exerted a strong influence on the various forms of the Scottish communion office till that of 1764, from which the prayer of consecration in the American Prayer-book is derived. Since the reign of John (1199-1216) the duchy of Normandy has been, except for a short period, a part of France.

II. a. Of or pertaining to Normandy or the Normans.—**Norman architecture**, a round-arched style of medieval architecture, a variety of the Romanesque, introduced before the Norman Conquest from Normandy into Great Britain, where it prevailed after the Conquest until the end of the twelfth century. The general character of this style is a massive and rugged simplicity, not destitute of studied proportion, and often

with the grandeur attendant upon great size and solidity. The more specific characteristics are—churches cruciform with apse and apsidal chapels, and a great tower rising from the intersection of nave and transept; vaults, plain and semi-cylindrical; doorways, the glory of the style, deeply recessed, often with rich moldings, covered with surface sculpture, sometimes continuous around both jamb and arch, but more usually springing from a series of shafts, with plain or enriched capitals; windows small, round-headed, placed high in the wall, and opening inward with a wide splay; piers massive, cylindrical, octagonal, square, or with engaged shafts; capitals cushion-, bell-, or lily-shaped, sometimes plain, more frequently sculptured in fanciful forms or in a reminiscence of the Corinthian or Ionic; buttresses broad, with but small projection; walls frequently decorated with bands of arcades of which the arches are single or interlaced. Toward the close of the twelfth century the style became much modified. The arches began to assume the pointed form; the vaults to be groined or formed by the intersection of two subsidiary vaults at right angles; the piers, walls, etc., to become less heavy; the lowers to be developed into spires; and the style, having assumed in every particular a more delicate and refined character, passed gradually into a new style, the early Pointed. Besides ecclesiastical buildings, the Normans reared many noble and powerful fortresses and castellated structures, the best remaining specimen of which in England is the White Tower or Keep of the Tower of London.—**Norman Conquest**, or simply *the Conquest*, in *Eng. hist.*, the conquest of England by William, Duke of Normandy (William the Conqueror). It was begun by and is usually dated from his victory at Senlac (Hastings) in 1066. The leading results were the

norther (nôr'thêr), *n.* [*<* *north* + *-er*.] **1.** A strong or cold northerly wind.—**2.** A violent cold north wind blowing, mainly in winter, over Texas and the Gulf of Mexico. A norther is always preceded by the passage of a cyclone, of which, in fact, it is the rear part. On the east side of a cyclone prevail warm, moist, southerly winds, while on the west side the winds are northerly. In the winter, when the temperature gradient from the Gulf of Mexico northward over Texas is very steep, the northerly winds following the passage of the center of a cyclone at times blow over this region with great fury, producing a very sudden and great fall of temperature. Over the Gulf, northers often cause wrecks in the Bay of Campeachy, on a lee shore.

Sometimes, instead of changing, the preceding wind dies entirely away, and a dead, oppressive, suffocating calm ensues, to be broken in a few hours by the wild bursts of the descending Norther.

Hence *nozzle*, *nozzle*, *nuzzle*.] 1. The special organ of the sense of smell, formed by modifications of certain bones and fleshy parts of the face, its cavities, or fossæ, freely communicable with the cavities of the mouth and lungs, and hence also concerned in respiration, the utterance of words or vocal sounds, and taste. It is lined throughout by a highly vascular mucous membrane called the *pituitary* or *Schneiderian*, continuous with the skin through the nostrils, the conjunctiva of the eye, and the mucous membrane of the pharynx and sinuses. It is in this membrane that the fine filaments of the olfactory nerves terminate, and over it the inspired air containing odorous substances passes. The olfactory region, or that region to which the olfactory nerves are distributed, however, includes only the upper and middle turbinate parts of the nasal fossæ and the upper part of the septum; the lower part of the cavities has nothing to do with olfaction. Externally the nose commonly forms a prominent feature of the face or facial region of the head; when very long it becomes a *proboscis*, and may acquire a tactile or manual function, as in the elephant, hog, mole, etc. The nose of an animal when moderately prominent is usually called a *snout*, *muzzle*, or *muffle*. The bridge of the nose is so much of its external prominence as is bridged over or roofed in by the nasal bones. The external opening of the nose is the *nostril*, usually paired, right and left, and technically called *nares*. The inner passages or cavities of the nose are the *nasal fossæ* or *meatus*; they open inferiorly into the upper part of the pharynx, by orifices called the *posterior nares* or *choana*, above the soft palate. The animal whose nose most resembles man's in size and shape is the proboscis-monkey, *Nasalis larvatus*, whose nose is

more prominent than that of most men. Prominence of the nose is to some extent an indication of ascent in the scale of human development, the nose being flattest in the lowest or negroid races. A large nose is commonly supposed to indicate strength of character, and thin clean-cut nostrils are generally a sign of high nervous organization. Besides its special function of smelling, the nose has in all animals a respiratory office, being, rather than the mouth, the usual passageway for air in both inspiration and expiration; it also serves to modify or modulate the voice, and to discharge the secretion from several cavities of the head, as the frontal and other sinuses, and the tears from the eyes. See cuts under *mouth*, *nasal*, *Nasalis*, and *Coudylura*.

notary¹ (nō'tā-ri), *n.*; pl. *notaries* (-riz). [= F. *notaire* = Pr. *notari* = Sp. Pg. It. *notario* = AS. *notere*, a writer, notary, *<* L. *notarius*, a stenographer, clerk, secretary, writer, *<* *nota*, a mark, a sign; see *note*¹.] **1.** In the earlier history of writing, a person whose vocation it was to make notes or memoranda of acts of others who wished to preserve evidence of them, and to reduce to writing deeds and contracts.—**2.** A public officer authorized by law to perform similar functions, and to authenticate the execution of deeds and contracts, and the accuracy of copies of documents, and to take affidavits and administer oaths. Such an officer, although now commonly spoken of as a *notary*, is more formally designated

as a *notary public*, or *public notary*. In England these officers are appointed by the Court of Faculties of the Archbishop of Canterbury, the office having arisen under the civil and ecclesiastical law. In France they are appointed by the government, although the power of appointment was formerly claimed by the Pope. In the United States they are appointed in the several States usually by the governor, the power of appointment being defined by the law of the State. The general powers of notaries are not defined by statute, being derived from the civil law and the law merchant; and their official acts, attested by signature and official seal, are generally received in evidence in whatever country they are offered, while similar acts of commissioners and other purely statutory officers are generally receivable only in the jurisdiction for which the officer was appointed, unless specially authenticated by some judicial authority. In various jurisdictions some special powers have been conferred upon notaries besides those derived from the origin and nature of their office.—**Apostolical notary**, an official charged with despatching the orders of the papal see.—**Ecclesiastical notary**, in the early church, a clerk or secretary, especially a shorthand-writer, employed to record the proceedings of councils and tribunals, report sermons, take notes, and prepare papers for bishops and abbots.—**Notary public**. See def. 2, above.

notary², notaryet, a. Corrupt forms of *notary*.

Notaspidea (nō-tas-pid'ē-ä), *n. pl.* [NL., *<* *Notaspis* + *-idea*.] A primary group of tectibranchiate gastropods, characterized by the development of either a large notæum or a true mantle, secreting a small external discoid shell. It includes the families *Pleurobranchitæ*, *Rumeinidæ*, and *Umbrellidæ*.

notaspis (nō-tas'pis), *n.* [NL., *<* Gr. *νώτος*, the back, + *σπίς*, shield.] **1.** The first well-defined central dorsal area of the embryo. It is the outward appearance of the germ-disk or germinative heap of endoderm- and mesoderm-cells within the blastodermic layer of cells of the ectoderm; at first circular, then elongated, oval, sole-shaped, slipper-shaped, canoe-shaped, etc.; and along its long axis soon appears the primitive furrow or primitive groove, in which the spinal column and spinal cord are to be laid down after this groove has turned into a tube. Also called *germ-shield*.

2. [cap.] In *entom.*: (a) Same as *Oribates*. (b) A genus of chalcid hymenopterous insects, founded by Walker in 1834. They have the abdomen almost sessile, middle tibiae spurred, ovipositor short, hind femora with a single large tooth, and the mesocostellum large and acuminate. N. *formiciformis* of St. Vincent's Island, the only species known, is no doubt parasitic.

notation (nō-tā'shōn), *n.* [= F. *notation* = Sp. *notación* = Pg. *notação* = It. *notazione*, *<* L. *notatio(n)*-, a marking, a designation, an observation, the designation of the meaning, an observation of a word, etymology, *<* *notare*, mark, designate; see *note*¹, *r.*] **1.** The act of noting, in any sense.—**2.** A system of written signs of things and relations (not of significant sounds or letters), used in place of language on account of its superior clearness and brevity. Notations are employed to advantage in every branch of mathematics, in logic, in astronomy, in chemistry, in music, in proof-reading, etc. (a) Two systems of arithmetical notation are now in use, the Roman and the Arabic. The Roman system is employed for numbering books and their parts, in monumental inscriptions, and in marking timber and other objects with the chisel. A large number in this system is written as follows: As many thousands as possible being taken from the number (without a negative remainder) an M is written for every thousand; five hundred is then taken, if possible, and D is written for it; as many hundreds as possible are next taken, and a C written for each; fifty is next taken, if possible, and L is written for it; as many tens as possible are next taken, and an X written for each; five is then taken, if possible, and V is written for it; and finally an I is written for every unit remaining. But usually instead of IIII is written IV; in place of VIIII, IX; in place of XXXX, XL; in place of LXXX, XC, etc. Anciently, there were other extensions of this system. The Arabic notation consists in the use of the Arabic figures and decimal places. See *Arabic* and *decimal*. (b) In the algebraic notation employed in all branches of mathematical analysis all objects upon which the operations of addition, multiplication, etc., are performed are denoted by letters. These objects are generally quantities (and are so called in describing the notation), though they may be operations, as in the calculus of functions, etc., geometrical conditions, as in enumerative geometry, or propositions, as in the calculus of logic. It is usual to give certain letters certain significations (for which see the letters). Furthermore, ∞ denotes infinite magnitude; ∅, the ratio of the circumference to the diameter, or 3.14159...; ∠, the Napierian base, or 2.71828...; ⊥, a right angle, etc. The sign = placed between two quantities states their equality: as, sp. gr. mercury = 13.5. In like manner, > means 'is greater than,' < 'is less than,' <= 'is as small as,' >= 'is as great as,' ≡ 'is smaller than or equal to,' ≧ 'is greater than or equal to,' ≦ 'is not equal to,' ≠ 'is not smaller than,' ≧≠ 'is not greater than,' ∝ 'is proportional to,' ≡ 'is congruent to,' in the theory of numbers. The last sign is also used to mean 'is identically equal to,' thus stating two relations, one mathematical, the other logical. The sum of two quantities is denoted by writing them with the sign +, called *plus*, between them: as, 3 + 2 = 5. The difference of two quantities is denoted by writing first the minuend, then the sign −, called *minus*, then the subtrahend: as, 5 − 3 = 2. When + or − occurs with no quantity before it, 0 is to be applied: thus, 3 − 5 = −2 means that 5 less than 3 is 2 below zero. But when a value has + or − after it and no quantity following, what is meant is that

something further is to be added or subtracted. The sign \pm , called *plus* or *minus*, is ordinarily used in a disjunctive sense in writing the root of a quadratic equation. Thus, if $x^2 + x = 1$, we write $x = -\frac{1}{2}(1 \pm \sqrt{5})$, meaning that the equation is satisfied only by the two values $x = -\frac{1}{2}(1 + \sqrt{5})$ and $x = -\frac{1}{2}(1 - \sqrt{5})$. The sign \pm is also used in astronomy, geodesy, etc., after a value determined by observation, to introduce the probable error of that determination. Summation is also signified by the letter Σ .

Thus, $\sum_{i=1}^n (1/i)$ means that in the expression $1/i$ all the whole numbers from 1 to n inclusive are to be successively substituted for i and the resulting values added together to give the quantity denoted by the expression. When the limits are not indicated, the lower one is to be understood as constant, and generally zero, and the upper one as one less than the actual value of the variable. For example, if we write $\sum_{i=1}^n (2x + 1) = x^2$, this signifies

$$\sum_{i=1}^n (2i + 1) = x^2.$$

In like manner, Δ is used to signify the difference, or the amount by which the quantity written after it would be increased by increasing the variable by unity. The variable may be indicated by a subjunctive letter; thus, $\Delta_x x^2 = (x+1)^2 - x^2$; but $\Delta x^2 = x^2 + 1 - x^2 = (x-1)x^2$. The product of two quantities is denoted by writing them in their order, either directly, or with an interposed cross (\times) or dot (\cdot); thus, $3 \times a = 3a$, $a = 5a$. A quotient is usually denoted by one of the signs \div or $/$, with the dividend before it and the divisor after it, or by a horizontal line with the dividend above and the divisor below. A continued product is also written with Π , just as a summation is written with Σ ; but when the limits are not indicated, the lower one is constant, and generally unity, and the upper one the actual value of the variable. A positive whole number with the mark of admiration (!) after it denotes the continued product of all numbers from 1 up to that number inclusive; thus, $4! = 24$. Instead of the mark of admiration, a right-angled line beneath and at the left of the number is sometimes used: as, \perp . A power of a quantity is denoted by writing the exponent to the right and above the base; thus, $x^3 = x \cdot x \cdot x$. This notation is extended to symbols of operation. Thus, $\Delta^2 u = \Delta \Delta u$; and $\Delta^{-1} u = \Sigma u$, because $u = \Delta \Delta^{-1} u = \Delta \Sigma u$. If the exponent is included in parentheses, the quantity denoted is the continued product of a number of factors equal to the exponent, one factor being the base, and the others the results of successive subtractions of 1 from the base; thus, $x^3 = x(x-1)(x-2)$. A root is denoted either by a fractional exponent, or by the sign $\sqrt{\quad}$ written before the base, with the index above and to the left; thus, $\sqrt[3]{8} = 2$. If the index is omitted, it is understood to be 2. One of the most important parts of algebraical notation is the use of parentheses, (\quad) , square brackets, $[\quad]$, braces, $\{\quad\}$, and vincula or horizontal lines above the expressions, to signify that the symbols so included are to be treated as signifying one quantity. Thus, $(3+2) \times 5 = 25$, but $3 + (2 \times 5) = 13$. Functions are usually denoted by operative symbols, especially f , F , ϕ , ψ , written before the variable, the latter being often included in parentheses. If there are several variables, these are included in one parenthesis and separated by commas, as $F(x, y)$. Various special functions have special abbreviations, as \log for logarithm, \sin for sine, \cos for cosine, \tan for tangent, \cot for cotangent, \sec for secant, \csc for cosecant, versin for versed sine, sinh for hyperbolic sine, am for amplitude, ar for sine of the amplitude, cn for cosine of the amplitude, etc. (For the special notation of matrices, determinants, graphs, and groups, see those words.) A differential is expressed by d before the function, and a partial differential is now generally written with ∂ instead of d ; the variable is indicated, if necessary, by a subjunctive letter. A variation is expressed by a δ before the varying quantity. A differential coefficient is most frequently expressed fractionally as a ratio of differentials, or by $\frac{d}{dx}$, etc., written before the function. But the capital D is often used; thus, $D^2 x^2 = yx^2 - 1$, and $Dy x^2 = \log x \cdot x^2$. Differentiation relatively to the time is especially expressed by accents; thus, $s' = Ds$ and $s'' = D^2 s$. Dots over the letters are also used instead of the accents, this being the original fluxional notation of Newton. The differential coefficients of a function are frequently denoted by accents attached to the operational symbols; thus, $f''x = D^2 f x$. A number of other differential operations are indicated by special operational symbols, as τ for Laplace's operator. The integral of an expression is written with the sign \int , introduced by Leibnitz, before the differential. The limits of a definite integral are written above and below this sign. Besides these notations, there are many others peculiar to different branches of mathematics.

3†. Etymological signification; etymology.
The notation of a word is when the original thereof is sought out, and consisteth in two things: the kind and the figure.
B. Jonson, Eng. Grammar, viii.

Conscience is a Latin word, and, according to the very notation of it, imports a double or joint knowledge. *South.*
4. In music, the act, process, or result of indicating musical facts by written or printed characters. As a process and a science, musical notation is a branch of semiotics or semiography in general. *Notation* is also used as a collective term for all the signs for musical facts taken together. Notation, whether regarded as a science or as a body of visible characters, may be divided into notation of pitch, of duration, of force, of style, etc. The various historic systems of notation are more particular about pitch than about the other matters. (a) The absolute and relative pitch of tones has been represented by letters, by neumes, by syllables, by numerals, by a staff, and by more than one of these methods at once. The ancient Greeks and Romans used their alphabets, assigning sometimes a separate letter or similar character to each tone of their tonal systems, and sometimes using only seven letters, which were repeated for successive octaves. The medieval notations included all the different methods, used both separately and in conjunction, letter-names being derived from the ancient notations, neumes appearing

early from an unknown source, and solmization and the staff-system being invented and developed from about the eighth or ninth century. Modern notations include all varieties except neumes. See *letter-name, neume, solmization, numeral, keyboard, scale, staff, etc.* (b) The absolute and relative duration of tones has been much less fully indicated than pitch. The ancient and medieval systems were decidedly defective in this regard. The appearance about the twelfth century of mensurable music necessitated the use of characters having a definite metrical value; hence came the note-system, which was combined with the staff, and also the various systems of tablature. In modern music two methods are used — notes whose shape indicates relative time-value, and a kind of tablature peculiar to the tonic sol-fa system. (See *note, tablature, tonic sol-fa (under tonic), etc.*) Furthermore, the general tempo of a piece or passage is indicated by such Italian terms as *grave, adagio, andante, moderato, allegro, riacce, presto*, etc. Alterations of tempo during a piece are indicated by *accelerando, più mosso, stringendo, ritardando, ritenuto, calando*, etc. The metrical treatment of individual tones is marked by *staccato, legato*, etc. (c) The absolute and relative force or accent of tones is still less fully indicated than pitch or duration. Vertical lines called *bars* have been used since medieval times to indicate rhythmical and metrical sections or measures, each of which begins with a primary accent. In modern music various words and arbitrary signs are used, as *forte, piano, crescendo* (\llcorner), *diminuendo* (\gg), *marcato*. (d) Other signs of various practical import are the *brace, repeat, da capo, dal segno, double bar, slur*, etc. See these words. (e) The general style of a piece or passage is often indicated in modern music by such terms as *ad libitum, agitato, arpeggio, cantabile, espressivo, sostenuto, con brio*. (f) Specific directions about performance by the voice or an instrument also occur, as *mezza voce, arcato, portamento, divisi, mano sinistra, pizzicato, sea (ottava), pedal*, and many others. All these verbal marks are translated into different languages, and are subject to modification for particular effects. (g) Modern music, following the later medieval music, also employs to some extent a kind of numerical shorthand for harmonic facts. See *thorough-bass, and figured bass (under bass)*. — **Alphabetic notation, in music.** See def. 4 (a). — **Architectural notation, a method adopted of placing signs to figures when marking dimensions on drawings:** as "for feet," "for inches," and "for parts," etc. — **Chemical notation, a system of abbreviating and condensing statements of the chemical composition of bodies, and of their changes and transformations, by means of symbols.** See *chemical formula, under chemical*. — **Decimal notation.** See *decimal*. — **Neumatic notation, in music.** See def. 4 (a), above, and also *neume*. — **Numerical notation, in music.** See def. 4 (g), above, and *numerical*. — **Staff-notation, in music.** See def. 4 (a) and (b), above, and also *staff and note*. — **Tonic sol-fa notation, in music.** See *tonic notator* (nō-tā'tōr), *n.* [*< ML. notator, (L. notare, note: see note¹, r.)*] An annotator. The pitch of the tone is indicated by the position of the note on the staff relative to the clef and the key-signature. (See *staff*, *clef*, *signature*, *key*.) The relative duration of the tone is indicated by the shape of the note. The system of notes now in use includes the following: the *breve*, ♭ ; the *semibreve* or *whole-note*, ♩ ; the *minim* or *half-note*, ♪ ; the *crotchet* or *quarter-note*, ♫ ; the *quaver* or *eighth-note*, ♬ ; the *semiquaver* or *sixteenth-note*, ♭ ; the *demisemiquaver* or *thirty-second-note*, ♮ ; and the *hemidemisemiquaver* or *sixty-fourth-note*, ♯ .

Each of these notes may be placed upon any staff-degree, and thus may signify a tone of any pitch whatever. Each of them, also, may have any time-value whatever, but when in a particular piece or passage a definite time-value is assumed for any one of them, a breve is then regarded equal in that piece or passage to two semibreves, a semibreve to two minims, a minim to two crotchets, etc. In other words, as a metrical notation, this system of notes is relative to an assumed value for one species, but absolute and definite after such an assumption. The pitch-value of a note may be modified by an *accidental* (which see), though the latter may also be regarded as changing the staff rather than the note. The time-value of a note may be modified by various marks, such as a *dot* after it (as $\text{♩} \cdot$ or $\text{♪} \cdot$), which lengthens the

note by one half its original value; the *tie* ($\text{♩} \text{---} \text{♩}$ or $\text{♪} \text{---} \text{♪}$), which binds two notes on the same pitch together and adds their respective values together; the *pause*, *hold*, or *fermata* (♩ or ♪), which lengthens the value of the note indefinitely according to the will of the performer; the *staccato* (♩ or ♪), which shortens the actual duration of the note and supplies the deficiency by a silence or rest. (See the various words.) This system is derived from the medieval systems, though with important changes. The Gregorian system of notes, which is still in use, is much nearer to the medieval system. It includes the following notes: the *large*, ♩ ; the *long*, ♪ ; the *breve*, ♭ ; and the *semibreve*, ♩ or ♪ .

These in turn were derived from the early neumes. They were first used merely as indications of pitch, their time-value being indefinite, and dependent wholly upon the text sung to them; but they acquired a definite metrical significance under mensurable music. In modern usage they are generally treated as metrical. A special development of the ordinary system of notes is that of *character-notes*, which are varied in shape so as to indicate not only various time-values, but also the scale-values or characteristic qualities of the tones indicated. Thus, the tonic or *do* is always represented by one shape, the dominant or *sol* by another, the subdominant or *fa* by a third, etc. The system thus aims to secure at once the utility of the staff and of a reference to the abstract scale. 6. In law: (a) Information; knowledge of facts: more specifically designated *actual notice*. Actual notice may be inferred from circumstances, as where proof of due mailing of a letter justifies the inference that he to whom it was addressed became cognizant of its contents; but he may disprove the fact, and

thus destroy the inference. (b) Such circumstances as ought to excite the attention of a person of ordinary prudence, and lead him to make further inquiry which would disclose the fact: more specifically designated *constructive notice*. Constructive notice is imputed by the law irrespective of the existence of actual notice, as where a deed is recorded, and a purchaser of the land neglects to consult the record, in which case the record is constructive notice; or where a purchaser takes a title from the former owner of land, relying on the fact that the record title is in him, while in fact a prior purchaser is in actual possession of the land, having paid for it, in which case the possession is constructive notice; and in either case the later purchaser, not having made inquiry, may be chargeable as if he had had actual notice of the prior purchaser's right. Constructive notice originated in the equitable rule that a man may, for the protection of the rights of a third person, be treated as if he had notice, when he had the means of information. (c) Information communicated by one party in interest to another, as where a contract provides that it may be terminated by either party on notice: more specifically designated *express notice*. (d) A written communication formally declaring a fact or an intention, as where notice is required in legal proceedings; a notification. — **7.** Written remarks or comments; especially, a short literary announcement or critical review. — **Due notice**. See *due*. — **Judicial notice**, that cognizance of matters of common knowledge, such as historical, geographical, and meteorological facts, the general usages of business, etc., which a judge or court may take and need upon without requiring evidence to be adduced. — **Notice of dishonor**, in *com. law*, a notice given to a drawer or indorser that a bill or note has been presented for acceptance (or payment) and the demand has been refused. The effect of such a notice is to charge the drawer or indorser with liability as such. — **Notice of protest**, in *com. law*, a notice of dishonor which states that a bill or note has been protested. But this term is often used in the popular sense of protest as not necessarily implying technical notarial protest, except in the case of paper, such as a foreign bill, which requires such technical protest. — **Reading notice**, a paid advertisement in a newspaper inserted in such form, style of type, etc., as to have the appearance of current news-matter or of an editorial utterance. — **To give notice**. (a) To inform; announce beforehand; warn; notify. (b) Specifically, to warn an employer that one is about to leave his or her service. — **Syn. 1.** Attention, observation, remark. — **3.** Notification, advice.

A general concept; a mental representation of a state of things. Thus, the general enunciation of a geometrical theorem is comprehended by means of notions, and only in that way can the property to be proved be firmly seized by the mind, and kept distinct from other properties of the same figure; but in order to prove the theorem a construction or diagram is requisite, involving a representation in the imagination capable of being studied so as to observe hitherto unknown relations in it.

A complexion of *notions* is nothing else but an affirmation or negation in the understanding or speech.

Burgersdicius, tr. by a Gentleman, I. ii. 4.
Concept or *notion* are terms employed as convertible; but, while they denote the same thing, they denote it in a different point of view. Conception, the act of which concept is the result, expresses the act of comprehending or grasping up into unity the various qualities by which an object is characterized; *notion*, again, signifies either the act of apprehending, signaling—that is, the remarking or taking note of the various notes, marks, or characters of an object which its qualities afford; or the result of that act. . . . The term *notion*, like conception, expresses both an act and its product.

3. In the *Lockian philos.*, a complex idea.

The mind often exercises an active power in making these several combinations; for, it being once furnished with simple ideas, it can put them together in several compositions, and so make variety of complex ideas, without examining whether they exist so in nature. And hence I think it is that these ideas are called *notions*, as if they had their original and constant existence more in the thoughts of men than in the reality of things.

It is one of the earliest embryonic structures, and persists throughout life in many of the lower vertebrates, which are on this account called *notochordal*; but in most cases it is soon absorbed and replaced by a definite cartilaginous or bony spinal column. The soft pulpy substance which may be seen filling in the cupped ends of the vertebrae of a fish, as brought to the table, is a part of the remains of the notochord. Anteriorly, in skull-ed vertebrates, the notochord runs into the base of the skull as far as the pituitary fossa. (See *parachordal*.) The caudal division of a notochord is often called *urochord*. Such a structure is characteristic of tunicates or ascidians, called on this account *Urochorda*, and approximated to or included among vertebrates. (See *Appendiculariidae*.) A sort of notochord occurring in the acorn-worms has caused them to be named *Hemichorda*. (See *Balanoglossus* and *Enteropneusta*.) The lancelets are named *Cephalochorda* with reference to the extension of this structure into the head. See *Chordata*, and cuts under *Pharyngobranchii*, *Chondrocranium*, *Lepidosiren*, and *Visceral*.

The posterior antennae are modified for attachment, and the creatures live in the branchial cavity of ascidians.

The habit is not geometridiform; the body is unusually stout; the proboscis is very short, if it appears at all; the palpi are usually of moderate length; the antennae are moderate, setaceous in the male, usually pectinate and rarely simple, in the female usually simple and rarely subpectinate; and the wings are deteched, entire, and usually long, with the submedian vein of the hind ones overrunning to the anal angle. It is a large family of nearly 100 genera. The larvae are naked, often eriously ornamented or armed, and they pupate either under or above ground. Some of them are known as *pebbles*, *prominents*, and *toothbacks*.

The membrane is distinctly marked, the body is broad, the scutellum is about as wide as the pronotum, and the front is narrow and curved without swelling or prolongation. These insects are all aquatic and predaceous, and swim about on their backs, whence the names *Notonecta* and also *back-swimmer* and *water-batman*. The genus is wide-spread, being represented almost everywhere. *N. undulata* is the commonest species in the United States; it is half an inch long, and varies in color from an ivory-white to a dusky hue. *N. maculosa* is the handsomest one, being brightly colored with red and yellow. They are deeper-bodied than related bugs, and their convexity is above, so that they swim on their backs. The eyes are large, reniform, doubly sinuate, and slightly projecting; there are no ocelli; the rostrum is long, sharp, conical, and four-jointed; the antennae are four-jointed; the tarsi are three-jointed; the hind legs are longest and fitted for rowing the body like oars, being thickly fringed with silky hairs; and the venter is keeled and hairy. noumenon (nō-ō'mē-non), *n.*; pl. *noumena* (-nā). [*cf.* Gr. *νοούμενον*, anything perceived, neut. of *νοοῦμενος*, ppr. pass. of *νοοῦν*, perceive, apprehend, < *νόος*, Attic *νοῖς*, the mind, the intelligence: see *nous*.] In the *Kantian philos.*: (a) That which can be the object only of a purely intellectual intuition.

If I admit things which are objects of the understanding only, and nevertheless can be given as objects of an intuition, though not of sensuous intuition (as *coram intellu intellectu*), such things would be called *Noumena* (intelligibilia). . . . Unless, therefore, we are to move in a constant circle, we must admit that the very word *phenomenon* indicates a relation to something, the immediate representation of which is no doubt sensuous, but which nevertheless, even without this qualification of our sensibility (on which the form of our intuition is founded), must be something by itself, that is, an object independent of our sensibility. Hence arises the concept of a *noumenon*, which, however, is not positive, nor a definite knowledge of anything, but which implies only the thinking of something without taking any account of the form of sensuous intuition. But, in order that a *noumenon* may signify a real object that can be distinguished from all phenomena, it is not enough that I should free my thought of all conditions of sensuous intuition, but I must besides have some reason for admitting another kind of intuition besides the sensuous, in which such an object can be given, otherwise my thought would be empty, however free it may be from contradictions. . . . The object to which I refer any phenomenon is a transcendental object. . . . This cannot be called the *noumenon*.
Kant, *Critique of Pure Reason* (tr. by Max Muller, 1881), [pp. 217, 219.]

In a negative sense, a *noumenon* would be an object not given in sensuous perception; in a positive sense, a *noumenon* would be an object given in a non-sensuous, i. e. an intellectual, perception.
E. Caird, *Philos. of Kant*, p. 498.

(b) Inexactly, a thing as it is apart from all thought; what remains of the object of thought after space, time, and all the categories of the understanding are abstracted from it; a thing in itself.

II. *n.* In *church hist.*, one of a sect founded in the middle of the third century by Novatianus (also called Novatus), a presbyter of Rome, who had himself consecrated bishop of Rome in opposition to Cornelius in 251. Another Novatus (of Carthage) was joint founder of the sect. Novatianus denied that the church had power to absolve or restore to communion those who after Christian baptism had lapsed or fallen into idolatry in time of persecution, and his followers appear to have refused the grant of forgiveness to all grave post-baptismal sin and denied the validity of Catholic baptism, considering themselves the true church. They assumed the name of *Cathari*, 'the Pure,' on the strength of their severity of discipline. In other respects than those mentioned the Novatians differed very little from the Catholics; and they were generally received back into communion on comparatively favorable terms. The sect continued to the sixth century. *See Sabbatian.*

3. In *law*, the substitution of a new obligation for an old one, usually by the substitution of a new debtor or of a new creditor. The term, however, is sometimes used of the substitution of a new obligation between the original parties, as the substitution of a bill of exchange for a right of action arising out of a contract of sale, though this is more commonly called *merger* or *extinguishment*. While in an *assignment* the old claim merely passes into other hands, in a *novation* there is a new claim substituted for it. The term is derived from the Roman law, where it was of great importance, because assignment of claims did not exist. It is possible by one *novation* to extinguish several obligations: as, if A owes a debt to B, B to C, and C to D, and it is agreed that A shall pay D in satisfaction of all, this promise, if consented to by all parties, extinguishes all the other claims, even though not performed.

3. In *civil law*, a new or supplemental constitution or decree; one of the novel constitutions of certain Roman emperors, so called because they appeared after the authentic publications of law made by these emperors. Those of Justinian (A. D. 527-65) are the best-known, and are commonly understood when the term is used. The *Novels*, together with the *Institute*, *Code*, and *Digest*, form the body of law which passes under the name of Justinian. Also *novella*.

By the civil law, no one was to be ordained a presbyter till he was thirty-five years of age; though by a later *novel* it was sufficient if he was above thirty.

The famous decision which Glanville quotes about legitimation is embodied in what then was an Extravagant of Alexander III., delivered to the bishop of Exeter in 1172, founded no doubt on a *Novel* of Justinian, but not till now distinctly made a part of church law.

Stubbs, *Medieval and Modern Hist.*, p. 306.

4. A fictitious prose narrative or tale, involving some plot of more or less intricacy, and aiming to present a picture of real life in the historical period and society to which the persons, manners, and modes of speech, as well as the scenery and surroundings, are supposed to belong. Its method is dramatic, and the novel may be regarded as a narrative play to the extent that the various persons or characters, upon whose qualities and actions the development and consummation of the plot or motive depend, are brought upon the scene to play their several parts according to their different personalities, disclosing, with the aid of the author's delineation and analysis, diverse aspects of passion and purpose, and contributing their various parts to the machinery of the drama to be enacted among them. The novel may be regarded as representing the third stage of transition in the evolution of fictitious narrative, of which the epic was the first and the romance the second. The novel in its most recent form may be divided, according to its dominant theme or motive, into the philosophical, the political, the historical, the descriptive, the social, and the sentimental novel; to which may be added, as special forms, the novel of adventure, the novel of society, the novel of character, the novel of criticism and satire, the novel of reform, and the military, the nautical, and the sporting novel.

Dime novel. See *dime*.—**Novels (or Novellæ) of Justinian.** See def. 3.—**Syn. 4. Tale, Romance, Novel.** *Tale* was at one time a favorite word for what would now be called a *novel*, as the *tales* of Miss Austen, and it is still used for a fiction whose chief interest lies in its events, as Marryat's *sea tales*. "Works of fiction may be divided into *romances* and *novels*. . . . The *romance* chooses the characters from remote, unfamiliar quarters, gives them a fanciful elevation in power and prowess, surrounds them by novel circumstances, verges on the supernatural or passes its limits, and makes much of fictitious sentiments, such as those which characterized chivalry. The poor sensational *novel* has points of close union with the earlier *romance*. . . . The *novel*, so far as it adheres to truth, and treats of life broadly, descending to the lowest in grade, deeply and with spiritual forecast, seeing to the bottom, is not only not open to these objections, but rather calls for . . . commendation." (a) In De Blainville's classification (1824), the last one of five orders of the second section of his *Paracelaphopoda monica*, divided into two families, *Nectopoda* and *Pteropoda*. The term is generally held to be a synonym of *Heteropoda*, but it is partly a synonym of *Pteropoda*, and these two groups are not exactly distinguished in the two families into which the author divides his nucleobranchs. Moreover, the order does not contain the genus *Caudofoveata*, which is pteropodous, and does contain the genus *Argonaut*, which is cephalopodous. It therefore corresponds to no natural group, and is disused. See *Nectopoda* and *Heteropoda*. (b) By some recent conchologists used as a substitute for *Heteropoda*.

In zool., the nucleus of a nucleus: one of the rounded deeply staining structures found in the nucleus of a cell. The relation they bear to the nuclear network is still uncertain. Some consider them as distinct from the nuclear network (Flemming); others consider them as merely thickened knots of

the network (Klein). The nucleolus of the human ovum was discovered by Wagner in 1836, and hence is sometimes called the *spot of Wagner* in anatomical text-books. See cut under cell, 5.

A large, clear, spherical nucleolus is seen in the interior of the nerve-cell; and in the centre of this is a well-defined small round particle, the *nucleolus*.
Huxley, Crayfish, p. 187.

2†. Specifically, in *Infusoria*, a minute particle attached to the exterior of the nucleus (or "ovary"), supposed to function as a testicle. But since it is the essential characteristic of a nucleolus to be contained within a nucleus, these so-called nucleoli of protozoans are now differently interpreted, and called *paranuclei*. See *paranuclei*.

3. In bot., a small solid rounded granule or particle in the interior of the nucleus. There may be several nucleoli in each nucleus.

nucleoplasm (nū'klē-ō-plazm), *n.* [*L. nucleus*, a kernel, + *NL. plasma* = *E. plasma*.] The more fluid part of the nucleus, found between the nuclear threads. See *nucleus*, I (a).

Not related to *E. nut*.] 1. A kernel; hence, a central mass about which matter is collected, or to which accretion is made; any body or thing that serves as a center of aggregation or assemblage; figuratively, something existing as an initial or focal point or aggregate; as, a *nucleus* of truth; a *nucleus* of civilization.

Then, such stories get to be true in a certain sense, and indeed in that sense may be called true throughout; for the very *nucleus*, the fiction in them, seems to have come out of the heart of man in a way that cannot be initiated of malice.
Hawthorne, Septimius Felton, p. 111.

The regiments fashioned by his [Cromwell's] master hand, steady, perfectly ordered, and enthusiastic in their cause, became the *nucleus* of the far-famed Ironsides.
Edinburgh Rev., CLXV, 465.

(a) In *bot.*, the kernel of a cell, in general; a central or interior differentiated mass of protoplasm, found in nearly all cells, vegetable or animal, and consisting of an oval or rounded body composed of (1) a nuclear membrane, (2) nuclear network, and (3) nucleoplasm, and containing nucleoli. The nuclear network is made up of threads or fibrils which are composed of a deeply staining part, "chromatin," and a feebly staining intermediate substance, "linin" or parachromatin (nucleohyaloplasm). In the meshes of the network is found the more fluid part of the nucleus, the nucleoplasm (achromatin, karyochylema, paralinin). Nucleoplasm, according to Carnoy, consists of a plastin network and a granular fluid, "enchylema." The nuclear membrane is considered by some observers to be an inner limiting layer of cell-protoplasm surrounding the nucleus, by others to be a condensation of the peripheral portion of the nuclear network. There may be but one nucleus or several nuclei in one cell; and a nucleus may be nucleolate or not. Nuclei are generally proportionate in size to the cell containing them; in some instances, however, they form almost the entire cell mass. A structural difference between the nucleus and the rest of the cell-protoplasm is indicated by its greater resistance to powerful reagents, and by its varied reaction with stains. Functionally, the nucleus is the most important portion of the cell, as it is here that the complex series of changes known as karyokinesis take place, resulting in the division of the nucleus and followed by the division of the cell. This process of mitotic or indirect cell-division is found in all varieties of cells, whether vegetable or animal, fetal or adult, normal or pathological. Instances of cell-division not mitotic have, however, been noted. The nucleus of the human ovum was discovered by Purkinje in 1825, and hence is often called the *corpuscle of Purkinje*. Its usual name in text-books of anatomy is *germinal vesicle*. See cut under cell, 5. (b) In *zool.*: (1) In ascidians, the alimentary and reproductive viscera collectively, when these are aggregated into a mass, as in the salps. (2) In protozoans, a solid rod-like or strap shaped body, having in many cases the functions of an ovary in connection with a nucleolus (see *nucleolus*, 2). (3) In echinoderms, the madreporiform body. (c) In *anat.*, a collection of ganglion-cells in the brain or other portion of the cerebrospinal axis. (d) In *conch.*, the embryonic shell which remains at the apex of the mature shell, as of a gastropod; also, the initial point from which the operculum of a gastropod grows. See *protoconch*. (e) A body having a stronger or weaker attraction for the gas, vapor, or salt of a solution than for the liquid part of it, and therefore modifying by its presence the freezing- and boiling-points. *Rosier*. (f) In *astron.*, the bright central point usually present in the head of a comet and often in a nebula.

5. In law, such a use of property or such a course of conduct as, irrespective of actual trespass against others or of malicious or actual criminal intent, transgresses the just restrictions upon use or conduct which the proximity of other persons or property in civilized communities imposes upon what would otherwise be rightful freedom. Thus, the use of steam-power, though on one's own premises ad for a lawful purpose, may be a nuisance, if by reason of being in one of several closely built dwellings the vibration and noise cause unreasonable injury to the adjacent property and occupants. Any serious obstruction to a highway or navigable river if not authorized by law is a nuisance; but the temporary use of a reasonable part of a highway for a legitimate purpose, such as the moving of a building or the deposit of building materials going into use, is not necessarily a nuisance. The question of nuisance always is, at what point the selfish use of a right transcends the obligation to respect the welfare of others. A *common nuisance*, or *public nuisance*, is one which tends to the annoyance of the public generally, and is therefore to be redressed by forcible abatement or by an action by the state, as distinguished from a *private nuisance*, or one which causes special injury to one or more individuals and therefore will sustain a private action. Thus, if one obstructs a highway any person may remove the obstruction, but only the public can prosecute the offender, unless a particular individual suffers special injury, as where he is turned from his road and compelled to go another way and suffers thereby a specific pecuniary damage, in which case it is as to him a private nuisance, and he may sue.

nunc (nungk), *n.* [Prop. **nunk*, unless it is an error for *nunch*: see *nunch*.] A large lump or thick piece of anything. Halliwell. [Prov. Eng.]

Nunc Dimittis (nungk di-mit'is). [So named from the first two words in the Latin version, *nunc dimittis servum tuum, Domine*, . . . in pace, 'now lettest thou thy servant depart in peace': L. *nunc*, now (see *now*); *dimittis*, 2d pers. sing. pres. ind. of *dimittere*, send forth, send away, dismiss: see *dismiss*.] The canticle of Simeon (Luke ii. 29-32). It is contained in the vesper office of the Greek Church, and is one of the canticles at evening prayer in the Anglican Church.

nunch (nunch), *n.* [Prob. a dial. var. of *lunch* or *hunch*, the form *nunc*, so spelled in Halliwell, being either for **nunk* (cf. *hunk*¹) or for *nunch*. The variation of the initial consonant in such homely monosyllables is not extraordinary. The same or like words vary also terminally: cf. *hunk*¹, *hunch*, *hump*, *lunch*, *lump*¹, *bnuch*, *bump*², etc. But *nunch* may arise from *nunch*, which, if that is of ME. origin: see *nunchoon*.]

1. A lump or piece. Compare *nunc*.—2. A slight repast; a lunch or luncheon. Compare *nunchoon*. Halliwell. [Prov. Eng.]

nunchoon (nun'chun), *n.* [Formerly also *nunchion*, *nunchin*, *nunchion*, *nunchion*, *nunchion*; appar. for **nunching* (as *luncheon* for **lunching*), *< nunch*, a piece, + *-ing*¹. As with the equiv. *luncheon*, also orig. dial., the termination lost meaning, and the word was altered by popular etym. to *noonchion*, and even in one case to *noonshun*, as if a repast taken when the laborers 'shun' the heat of 'noon,' *< noon*¹ + *shun*; the association with *noon* being either accidental, or else due to the origination of *nunchoon*, as Skeat claims, in the rare ME. *nonchenche* for **nonchenche*, a donation for drink, lit. 'noon-

drink,' *< none*, noon, + *schenche*, a cup (hence 'drink'), *< schenchen*, *shenchen*, *shenken*, *skinken*, give to drink: see *noon*¹ and *skink*. The reduction of ME. **nonchenche* to *nunchoon* is irregular, but is possible, the form **nonchenche* being awkward and unstable. Cf. *noonmeat* and *bever*³.] A light meal taken in the middle of the day; a luncheon.

A papal ambassador of the first rank sent on a special temporary mission is styled a *legate*. (See *legate*.) *Nuncios* formerly acted as judges of appeal. In Roman Catholic kingdoms and states holding themselves independent of the court of Rome in matters of discipline, the nuncio has merely a diplomatic character, like the minister of any other foreign power.

A certain restraint was given out, charging his *nuncios* and legates (whom he had sent for the gathering of the first fruits of the benefices vacant within the realm), etc. Foxe, Martyrs, p. 417.

2. In the law of wills, oral; not written; made or declared by word of mouth. A nuncupative will is made by the verbal declaration of the testator, and usually depends merely on oral testimony for proof. In Scotland, a nuncupative legacy is good to the extent of £100 Scots, or 28 *cs. sd.* sterling. 2. In *pathol.*, a constant nodding or involuntary shaking of the head. *Dunglison*.—3. In *astron.*, a small subordinate gyratory movement of the earth's axis, in virtue of which, if it subsisted alone, the pole would describe among the stars, in a period of about nineteen years, a minute ellipse, having its longer axis directed toward the pole of the ecliptic, and the shorter, of course, at right angles to it. The consequence of this real motion of the pole is an apparent approach and recession of all the stars in the heavens to the pole in the same period; and the same cause will give rise to a small alternate advance and recession of the equinoctial points, by which both the longitudes and the right ascensions of the stars will be also alternately increased or diminished. This nutation, however, is combined with another motion—namely, the precession of the equinoxes—and in virtue of the two motions the path which the pole describes is neither an ellipse nor a circle, but a gently undulated ring; and these undulations constitute each of them a nutation of the earth's axis. Both these motions and their combined effect arise from the same physical cause—namely, the action of the sun and moon upon the protuberant mass at the earth's equator. See *precession*.

The phenomena of Precession and Nutation result from the earth's being not centrobaric, and therefore attracting the sun and moon, and experiencing reactions from them, in lines which do not pass precisely through the earth's centre of inertia, except when they are in the plane of its equator. *Thomson and Tait, Nat. Phil.*, § 825.

(See *mace*².) The

seed is thoroughly dried, the shell then cracked, and the olive-shaped kernel, about an inch in length, commonly treated with lime for preservation, becomes the nutmeg of commerce. Its principal use is that of an aromatic condiment, especially to flavor milky and farinaacea preparations. (For medical use, see *Myristica*.) Its virtues depend upon an essential oil, called *nutmeg-oil*. It yields also a concrete oil called *nutmeg-butter*. 1. The fifteenth letter and fourth vowel in our alphabet. It followed *N* also in the Italian systems, but was separated from it in Greek and Phœnician by another character, which in the latter had the value of a syllable, and in the former that of the compound *ks* (ξ). The *O*-character, accordingly, was the sixteenth in the Phœnician alphabet, and it represented there the 'ain, a very peculiar and to us unpronounceable guttural; the Greeks (as in the case of *E*: see that letter) arbitrarily changed its value to that of a vowel, corresponding in quality to our "long *ō*." There is no traceable Egyptian prototype for the character; the comparison of older forms is therefore as follows:

represented there the 'ain, a very peculiar and to us unpronounceable guttural; the Greeks (as in the case of *E*: see that letter) arbitrarily changed its value to that of a vowel, corresponding in quality to our "long *ō*." There is no traceable Egyptian prototype for the character; the comparison of older forms is therefore as follows:

It thus appears that the belief, not uncommonly held, that *O* represents, and is imitated from, the rounded position of the lips in its utterance, is a delusion. The historical value of the letter (as already noticed) is that of our *o*, in *note*, etc., whether of both long and short quantities, as in Latin and the earliest Greek, or of short only, as in Greek after the addition to that alphabet of a special sign for long *o* (namely *omega*, Ω, ω). This vowel-sound, the name-sound of *o*, is found in English usage only with long quantity in accented syllables. There is no closely corresponding short vowel in standard English, but only in dialectal pronunciation, as in the New England utterance of certain words (much varying in number in different individuals); for example, *home*, *whole*, *none*. What we call "short *o*" (in *not*, *on*, etc.) is a sound of altogether different quality, very near to a true short *ā* (that is, a short utterance corresponding to the *a* of *arm*, *father*), but verging slightly toward the "broad" *a* (*ā*) or *ō* (*ō*) of *laud*, *lord*. "Short *o*" has a marked tendency to take on a "broader" sound, especially before *r*, and especially in America: hence the use, in the respellings of this work, of *ō*, which varies in different mouths from the full sound of *ā* to that of *ō*. After these three values of the character, the next most common one is that of the *oo*-sound, the original and proper sound of *u* (represented in this work by *ū*), as in *more*, with the nearly corresponding short sound (marked *ū*) in a few words, as *wolf*, *woman*. All these vowel-sounds partake of what is usually called a "labial" or a "rounded" character: that is to say, there is involved in their utterance a rounding and closing movement of the lips (and, it is held, of the whole mouth-cavity), in different degrees — least of all in *ō*, more and more in *ā*, *ū*, *ū*; in the last, carried to its extreme, no closer rounding and approximation being possible. The labial action helps to give the vowel-sounds in question their fully distinctive character; but it can be more or less slighted without leaving them unrecognizable, and, in the generally indifferent habit of English pronunciation, is in a degree neglected, even in accented syllables, and yet more in unaccented. Our "long *ā*," it should be added, regularly ends with a vanishing sound of *oo* (*ū*), as our *ū* with one of *ē*. *O* also has in many words the value of the "neutral" vowels of *hut*, *hurt*: for example, in *son*, *come*, *love*, *work*. *O* is further a member of several very common and important digraphs: thus, *ou*, the most marked representative of the *o*-sound (in *moon*, *road*, etc.), but also pronounced as *ū* (*book*, *look*, etc.) and *ū* (*blood*, etc.); *ou* (in certain situations *ou*), oftenest representing a real diphthong (in *out*, *sound*, *now*, etc.), but also a variety of other sounds (as in *through*, *could*, *ought*, *rough*); *oi* (in certain situations *oi*), standing for a real diphthongal sound of which the first element is the "broad" *o*- or *a*-sound (for example, *point*, *boy*); *oa* (*load*, etc.), having the "long" *o*-sound; others, as *oeo* (variously pronounced, as in *people*, *yeoman*, *jeopard*), *oe* (in *foe*, *does*, etc.), are comparatively rare.

A tree or shrub of the genus *Quercus*, a large and widely dispersed group, chiefly of forest-trees. In its nobler representatives the oak as "the monarch of the forest" has always been impressive, and it anciently held an important place in religious and civil ceremonies. Oak chaplets were a reward of civic merit among the Romans; the Druids venerated the oak as well as the mistletoe which grows upon it. The timber of many species is of great economic value, and the bark of several is used for tanning and dyeing and in medicine. (See *oak-bark* and *quercitron*.) One species furnishes cork (see *cork*). The fruit-cups of some are used in tanning (see *valonia*). (See also *gall*, *kermes*, and *kermes-oak*.) The oak of English history and literature is chiefly the British oak, *Quercus robur*, having two varieties, *pedunculata* and *sessiliflora*, often regarded as species. The species is distributed throughout a great part of Europe and in western Asia. It attains great age, with an extreme height of 120 feet. For ship-building its timber is considered invaluable, having the requisite toughness and most other qualities without extreme weight, and until recently it was the prevailing material of British shipping. It is also used for construction, cabinet-work, etc. Its bark is

a tanning substance of great importance. In the eastern half of North America the white oak, *Q. alba*, in England sometimes called *Quebec oak*, occupies a somewhat similar but less commanding position. It rises from 70 to 140 feet, and affords a hard, tough, and durable wood, used, though not equal to the English oak, in ship-building, construction of all sorts, the manufacture of carriages and implements, cabinet-making, etc. The bur, overcup, or mossy-cup oak, *Q. macrocarpa*, is a tree of similar range, equal size, and even superior wood, which is not always distinguished from that of the white oak.

It consists of two parts—a flat feather-shaped or spoon-shaped part called the *blade*, which is dipped into the water in rowing, and a rounded part called the *loom*, ending in a piece of less diameter than the rest, called the *handle*. The oar rests in a hole or indentation in the gunwale, called the *rowlock* or *oar-lock*, or between two pins called *thole-pins*, or in a metal rest or socket. The action of an oar in moving a boat is that of a lever, the rower's hand being the power and the water the fulcrum. Oars are frequently used for steering, as in whale-boats.

And it ought to touch the heart of the most callous of conservative agriculturists to spend twenty minutes of flinging and sampling in the aromatic warmth of a well-arranged tobacco oast-house, where the luxuriant crop hangs in long vias of tawny-coloured tassels, each tassel "hand" composed of the wide fronds in their unbroken integrity, strung on a lath and hung points downwards!

oat (ōt), *n.* [Early mod. E. also *ote, otes*, dial. (Sc. *oits*; < ME. *ote, oote*, earlier *ate* (usually in pl., *ates*, earlier *oten*), < AS. *āte* (in earliest form *ātā*), pl. *ātan*, oat (tr. L. *avena*), also cockle, tares (tr. L. *lotium* and *zizania*); not found in other tongues. Some compare the Icel. (dim.) *citill*, a nodule in stone, = Norw. *etel*, a knot, nodule, gland; also Russ. *yadro*, a kernel, ball, Gr. *οἶδος*, a swelling (see *edema*); the name being given, in this view, with ref. to its rounded shape. Others compare the AS. *etan*, E. *eat* (cf. *āt* = Icel. *āta*, also *ati*), meat, prey; but why oats should be singled out as 'that which has a rounded shape' or 'that which is eaten,' from other grains of which the same is equally or more true, is not clear.] 1. (a) A cereal plant, *Avena sativa*, or its seed: commonly used in the plural in a collective sense. The oat was already in cultivation before the Christian era, and is sown in a variety of soils in all cool climates, degenerating

toward the tropics, yet not ripening quite as far north as barley. Oats are grown chiefly as food for beasts, especially horses, being most largely so used in the United States; but they also form an important human food (especially in Scotland, of late years somewhat in the United States), in point of nutrition ranked higher by some than ordinary grades of wheat flour. (See *oatmeal, groats, and sovens*.) All the varieties of the ordinary cultivated oat are referred to *A. sativa*, but this is believed by many to be derived from the wild oat, *A. fatua*. The race called *naked oat*, sometimes regarded as a species, *A. nuda*, differs from other sorts in having the seed free from the glume. It is successful in Ireland, etc., but not in America. A variety well approved in both hemispheres is the potato-oat, with a large white plump grain, the original of which was found growing accidentally with potatoes. The black Poland is another esteemed variety; the Tartarian and the Siberian are recommended for poor soils. The varieties are numerous, new ones constantly appearing.

It fell on a day, and a bonny simmer day,
When green grew aite and barley.
Bonnie House of Airly (Child's Ballads, VI. 186).

The country squires brewed at home that strong ale which, after dinner, stood on the table in decanters marked with the oat and was drunk in lieu of wine.

S. Dowell, Taxes in England, IV. 68.

(b) Any species of *Avena*. The wild oat of Europe, *A. fatua*, is a weed of cultivation in many places; in California, where it abounds, it is extensively utilized as hay. The animal, dry, or hygrometric oat, *A. sterilis*, native to Barbary, has two long, strong, much-bent awns, which twist and untwist with changes of moisture, and so become a means of locomotion. Various species are more or less available for pasture.

1. A solemn appeal to the Supreme Being in attestation of the truth of some statement or the binding character of some covenant, undertaking, or promise; an outward pledge that one's testimony or promise is given under an immediate sense of responsibility to God.

All the officers appointed by congress were to take an *oath* of fidelity as well as of office.
Bancroft, Hist. Const., II. 113.

2. The form of words in which such attestation is made. Oaths are of two kinds: (a) assertory oaths, or those by which something is asserted as true, and (b) promissory oaths (see *promissory oath*, *oath of allegiance*, and *oath of office*, below). Witnesses are allowed to take an oath in any form which they consider binding on their conscience. Provision is made in the cases of those who have conscientious objections to the taking of an oath, or those who are objected to as incompetent to take an oath, whereby they are allowed to substitute an affirmation or solemn promise and declaration. Oaths to perform illegal acts do not bind, nor do they excuse the performance of the act.

3. A light or blasphemous use of the name of the Divine Being, or of anything associated with the more sacred matters of religion, by way of appeal, imprecation, or ejaculation.

And specially in youth gentillmen ben tawght

Every hoy wenyth it be annex to curtesy.
MS. Laud 416, f. 89. (Halliwell, under jentery.)

Quoted in *Capt. John Smith's Works, l. 197.*

4. Loosely—(a) An ejaculation similar in form to an oath, but in which the name of God or of anything sacred is not used.

And laughed, and blushed, and oft did say
Her pretty oath, by Yea and Nay.
Scott, Marmion, v. 11.

(b) An imprecation, differing from a curse in its less formal and more exclamatory character: it may be humorous, or even affectionate, among rude and free-living men. (c) An exclamatory word or phrase, usually without appropriateness to the subject in hand, expressing surprise, and generally displeasure, though sometimes even approval or admiration. It may refer to something sacred, and even be what is called blasphemous, but is often wholly unmeaning, or is a corruption or softening of an originally blasphemous expression, as *zounds!* for *God's* (Christ's) *wounds*, *egad* for *by God*, etc.—**Corporal oath.** See *corporal*.—**Highgate oath,** a jocular asseveration which travelers toward London were required to take at a tavern at Highgate. Menno attached himself to the *Obbenites*, who held that on earth true Christians had no prospect but to suffer persecution, refused to use the sword, and looked for no millennium on earth.
Encyc. Brit., XVI. 12.

In at least most of the genera and orders where *obdiplostemony* has been noticed in the completely developed flower, it is simply due to the petaline whorl of filaments being, so to say, thrust outside the level of the calycine whorl by the protruding buttress-like bases of the carpels, as in *Geranium pratense*.

=*Syn.* 1. *Obdurate*, *Callous*, *Hardened*. These words all retain the original meaning of physical hardening, although it is obsolescent with *obdurate*. In the moral signification, the figure is most felt in the use of *callous*, which indicates sensibilities to right and wrong deadened by hard treatment, like *callous* flesh. *Hardened* is less definite, it being not always clear whether the person is viewed as made hard by circumstances or as having *hardened* himself against better influences and proper claims. *Obdurate* is the strongest, and implies most of determination and active resistance. See *obstinate*.

than three fourths of the thickness at the base. The two largest were erected by Sesostris in Heliopolis; the height of these was 78 feet; they were removed to Rome by Augustus. Two *obelisks* in Alexandria, known as Cleopatra's Needles, were offered by Mehemet Ali to Great Britain and France respectively. The French chose instead the Luxor *obelisk*, which was erected in the Place de la Concorde in Paris in 1833. That chosen by the British lay prostrate in the sand until it was removed and erected on the Thames embankment in London, in 1878, by private enterprise. Its height is 68 feet 5 1/2 inches, and its dimensions at the base are 7 feet 10 1/2 inches by 7 feet 5 inches. The companion *obelisk* was afterward presented to the city of New York, where it now stands in Central Park, having been transported thither in 1880 by private enterprise.

A species of magical art or sorcery practised by the negroes in Africa, and formerly prevalent among those living in the West Indies, where it was introduced by African slaves. Traces of the same or similar superstitions and practices are still found both in the West Indies and in some of the southern United States. The charms used are bones, feathers, rags, and other trash, but it is upon a secret and skilful use of poison that the peculiar terror of the system is supposed to depend. The negroes have recourse to the *obi* for the cure of diseases, gratification of revenge, conciliation of enemies, discovery of theft, felling of fortunes, etc.

Things suffer in general; the slaves run away or are inclined to be turbulent; he [the bad head driver] and they cabal; bad sugar is made; and perhaps the horrid and abominable practice of *Obca* is carried on, dismembering and disabling one another; even aiming at the existence of the white people.

5. In *gram.*: (a) A member of the sentence, a substantive word or phrase or clause, immediately (that is, without the intervention of a preposition) dependent on a verb, as expressing that on which the action expressed by the verb is exerted. The *object* of a verb is either *direct* or *indirect*. A direct *object* receives the direct action of the verb, and is in the accusative or objective case, so far as there is a distinctive form for that case, and a verb admitting such an *object* is called *transitive*: as, he saw *me*; they gave a *book*; an indirect *object* represents something (usually) to or for which the action is performed, and so is in the dative case, so far as that case is distinguished (as only imperfectly in English); thus, they gave *her* a book; I made the *boy* a coat; but in some languages indirect *objects* of other cases occur. A direct *object* which repeats in noun form an idea involved in the verb is called a *cognate object*; as, I dreamed a *dream*; they run a *race*. The name *factive object* is often given to an objective predicate. See *predicate*. (b) A similar member of the sentence dependent on a preposition, i. e. joined by a preposition to the word it limits or qualifies: as, he went with *me*; a man of *spirit*. Such an *object* is in English always in the accusative or objective case; in other languages often in other cases, as genitive, dative, ablative. The *object*, whether of a verb or of a preposition, is said to be *governed*—that is, required to be of a particular case—by the verb or preposition.

Shak., Cor., i. 1. 21.

7. A deformed person, or one helpless from bodily infirmity; a gazing-stock. [Colloq.]

"What!" roars Maedonald—"You pur shauhlin' in-kneed seray of a thing! Would any Christian body even you bit *object* to a bonny sonse weel-faured young woman like Miss Catline?"
Lockhart, *Reginald Dalton*, III. 118.

8. An obstacle. [Rare.]
 To him that putteth not an *object* or let (I use the schoolmen's words)—that is to say, to him that hath no actual purpose of deadly sin, [the sacraments] give grace, righteousness, forgiveness of sins.
Becon, *Works*, III. 330. (*Darvies*.)

Egoistical, exterior, external, first, formal, material, mediate, etc., object. See the adjectives.

objectable (ob-jek'ta-bl), *a.* [*<* OF. *objectable*; as *object*, *v.*, + *-able*.] Capable of being made or urged as an objection. [Rare.]

It is as *objectable* against all those things which either native beauty or art affords.
Jer. Taylor (?), *Artif. Handsomeness*, p. 145.

objection (ob-jek-tā'shon), *n.* [*<* L. *objectio* (n-), a reproach, *<* *objectare*, reproach; see *object*.] *Reproach* or *evil*; cations *objection*.

All the knotty questions of the realm are referred to us, and, when they are discussed in the common hearing, each of us, without strife or *objection*, sharpens his wits to speak well upon them.

Peter of Blois (trans.), in *Stubbs's Medieval and Modern Hist.*, p. 143.

object-finder (ob-jekt-fin'dēr), *n.* In microscopes, a device to enable the observer to fix the position of an object in the slide under examination, so that he can find it again at will. It is especially necessary when high powers are employed. Various forms of finders have been devised; one of the most common involves the use of a slide with horizontal and vertical scales, adjusted in connection with the mechanical stage.

object-glass (ob-jekt-glās), *n.* In a telescope or microscope, the lens which first receives the rays of light coming directly from the object, and collects them into a focus, where they form an image which is viewed through the eyepiece. In the finest refracting telescopes the object-glass consists of an achromatic combination of lenses, formed of substances having different dispersive powers, and of such figures that the aberration of the one may be corrected by that of the other. Ordinarily the combination consists of a convex lens of crown-glass and a concave lens of flint-glass, having focal lengths proportional to their dispersive powers. There are many different forms which fulfill the condition indicated, but vary in the curves of the lenses, their thickness, their relative position, and the distance between them. With the ordinary crown- and flint-glass it is not possible to obtain perfect achromatism; with the new kinds of glass made at Jena a much more perfect correction is possible, and it is likely that as a result telescopes will soon be greatly improved, provided the glass can be made in pieces of sufficient size and satisfactorily homogeneous. See *objective*, *n.*, 3, and cuts under *microscope*.

objectification (ob-jek'ti-fi-kā'shon), *n.* [*<* *objectify* + *-ation* (see *-fication*).] The act or process of objectifying or of making objective. Also *objectivation*.

The diminution or increase of that which is perceived (of course, unreflectingly) as the area of self-assertion, or (if we like the phrase) as "the objectification of the will," is essentially and immediately connected with our own discomfort or pleasure.

F. H. Bradley, *Ethical Studies*, p. 254.
objectify (ob-jek'ti-fi), *v. t.*: pret. and pp. *objectified*, pp. *objectifying*. [*<* ML. *objectum*, an object, + L. *-ficare*, make: see *object* and *-fy*.] To make objective; present as an object; especially, to constitute as an object of sense; give form and shape to as an external object; externalize. Also *objectivate*, *objectize*.

Because it [mind] is bound to think a coexistence or sequence, it *objectifies* the necessity.
Maudsley, *Body and Will*, p. 127.

He may be quite innocent of a scientific theory of vision, but he *objectifies* his sensations.
T. H. Green, *Prolegomena to Ethics*, § 12.

What we start with in the child is the feeling of himself affirmed or negated in this or that sensation; and the next step . . . is that the content of these feelings is *objectified* in things.
F. H. Bradley, *Ethical Studies*, p. 251.

objection (ob-jek'shon), *n.* [= F. *objection* = Sp. *objecion* = Pg. *objecção* = It. *obbiezione*, *objezione*, *<* LL. *objectio* (n-), a throwing or putting before, a reproaching, ML. an objection, *<* L. *objicere*, *obicere*, pp. *objectus*, throw before, *object*: see *object*, *v.*] 1. Sheridan, *The Rivals*, i. 2.

2. That which is interposed or presented in opposition; an adverse contention, whether by or without stating the opinion, reason, or argument on which it is founded: as, many *objections* to that course were urged; the *objections* of the defendant were overruled.

As for your spiteful false *objections*,
 Prove them, and I lie open to the law.
Shak., 2 Hen. VI., l. 3. 153.

Objections to my general System

4. Trouble; care; cause of sorrow or anxiety.

Our way is troublesome, obscure, full of *objection* and danger.

objective (ob-jek'tiv), *a.* and *n.* [= *F.* *objectif* = *Sp.* *objetivo* = *Pg.* *objetivo* = *It.* *obbiettivo*, *obbiettivo*, *<* *ML.* *objectivus*, relating to an object, *<* *objectum*, an object; see *object*, *n.* Cf. *subjective*.] *I.* *a.* 1. As perceived or thought; intentional; ideal; representative; phenomenal: opposed to *subjective* or *formal*—that is, as in its own nature. (This, the original meaning which the Latin word received from Duns Scotus, about 1300, almost the precise contrary of that now most usual, continued the only one till the middle of the seventeenth century, and was the most familiar in English until the latter part of the eighteenth.)

Natural phenomena are only natural appearances. They are, therefore, such as we see and perceive them. Their real and objective natures are therefore the same. *Berkeley*.

The faculty of the imagination, for example, and its acts were said to have a subjective existence in the mind; while its several images or representations had, qua images or objects of consciousness, only an objective. Again, a material thing, say a horse, qua existing, was said to have a subjective being out of the mind; qua conceived or known, it was said to have an objective being in the mind. *Sir W. Hamilton*, in Reid's Supplementary Dissertations, [note B, § 1.

Where or when should we ever able to search out all the vast treasures of objective knowledge that lay within the compass of the universe? *Sir M. Hale*, Orig. of Mankind, p. 156.

[By *objective* knowledge was meant the propositions known, opposed to *formal* or *subjective* knowledge, the act or habit of knowing. Such expressions probably led to the change of meaning of the word.]

2. Pertaining or due to the real object of cognition; real: opposed to *subjective* (pertaining or due to the subject of cognition, namely, the mind). (This meaning of the word nearly reverses the original usage; yet if such passages as that from Sir M. Hale, above, on the one hand, and that from Watts, below, on the other, be compared, the transition will be seen to have been easy. Kant makes the objects of experience to be at once real and phenomenal; and what he generally means by the *objective* character of a proposition is the force which it derives from the thing itself compelling the mind, after examination, to accept it. But concerning Kant uses *objective* to imply a reference to the unknowable thing in-itself to which the compelling force of phenomena is due.)

Objective certainty is when the proposition is certainly true in itself; and *subjective* when we are certain of the truth of it. The one is in things, the other is in our minds. *Watts*, Logic, ii. 2. § 8.

[Thus, there is an *objective* certainty in things that any given man will die; and a *subjective* certainty in his mind of that *objective* certainty.]

Objective means that which belongs to, or proceeds from, the object known, and not from the subject knowing, and thus denotes what is real, in opposition to what is ideal—what exists in nature, in contrast to what exists merely in the thought of the individual.

Sir W. Hamilton, Metaph., ix.

A form of consciousness, which we cannot explain as of natural origin, is necessary to our conceiving an order of nature, an *objective* world of fact from which illusion may be distinguished.

T. H. Green, Prolegomena to Ethics, § 19.

If an exact *objective* measurement of the physical stimulus is intrinsically difficult, an exact *subjective* measurement of the sensations themselves is inherently impossible. *G. T. Ladd*, Physiol. Psychology, p. 361.

The number of vibrations is the *objective* characteristic of that which we perceive subjectively as colour. *Lommel*, Light (trans.), p. 226.

3. Substantive; self-existent. [This rather confusing use of the word belongs to writers of strong nominalistic tendencies.]

Science . . . agrees with common sense in demanding a belief in real *objective* bodies, really known as causes of the various phenomena the laws and interrelations of which it investigates. *Miscell.*, Nature and Thought, p. 29.

The only other thing in the physical universe which is conserved in the same sense as matter is conserved, is energy. Hence we naturally consider energy as the *objective* reality in the physical universe.

Tait, in Encyc. Brit., XV. 747.

4. Intent, as a person, upon external objects of thought, whether things or persons, and not watching one's self and one's ways, nor attending to one's own sensations; setting forth, as a writing or work of art, external facts or imaginations of such matters as they exist or are supposed to exist, without drawing attention to the author's emotions, reflections, and personality.

The only healthful activity of the mind is an *objective* activity, in which there is as little brooding over self as possible. *J. Fiske*, Cosmic Philos., I. 142.

The two epics [the Iliad and Odyssey] appear on the horizon of time so purely *objective* that they seem projected into this visible diurnal sphere with hardly a subjective trace adhering to them, and are silent as the stars concerning their own genesis and mutual relation.

H. D. Geddes, Problem of the Iliadic Poems, II.

The theme of his [Dante's] poem is purely subjective, modern, what is called romantic; but its treatment is *objective* (almost to realism, here and there), and it is limited by a form of classic severity.

Lowell, Among my Books, 2d ser., p. 37.

5. In gram., pertaining to or noting the object of a transitive verb, or of a preposition; forming or expressing a grammatical object: as, the *objective* case; an *objective* phrase or clause. Abbreviated *obj.*—**Objective abstraction**, **beatitude**, **being**, **doubt**. See the nouns.—**Objective cause**, the external object which excites the principal cause of any effect to action; the procatartical cause.—**Objective concept**, a concept conceived as constituting a real likeness among the objects which come under it: opposed to a *formal concept*, or the concept regarded merely as a function of thought.—**Objective end**, **ens**, **evidence**, **idealism**, etc. See the nouns.—**Objective line**, in *persp.*, any line drawn on the geometrical plane the representation of which is sought in the draft or picture.—**Objective logic**, the logic of objective thought; the general account of the process by which the interaction of ideal elements constitutes the world. *Hegel*.—**Objective method**, the inductive method; the method of modern science.—**Objective philosophy**. Same as *transcendental philosophy* (which see, under *philosophy*).—**Objective plane**, any plane, situated in the horizontal plane, whose perspective representation is required.—**Objective point**.—(a) The point or locality aimed at; the final or ultimate point to which or to reach which one's efforts or desires are directed; specifically (*milit.*), the point toward securing which a general directs his operations, expecting thereby to obtain some decisive result or advantage. Hence—(b) The ultimate end or aim; that toward the attainment of which effort, strategy, etc., are directed.—**Objective power** or **potency**, that of a consistent object of thought; logical possibility; non-existence combined with non-repugnance to existence.—**Objective reality**, the reference of a concept to an object.—**Objective reason** or **thought**, in *metaph.*, reason or thought as existing not in the individual mind, but as in the real objects of cognition.

A truly *objective* thought, far from being merely ours, must at the same time be what we have to discover in things, and in every object of perception.

Hegel, tr. by Wallace, Logic of the Encyclopedia, § 41.

Objective symptoms, in *med.*, symptoms which can be observed by the physician, as distinct from *subjective symptoms*, such as pain, which can be directly observed only by the patient.—**Objective truth**, the agreement of a judgment with reality; material truth.—**Objective validity**, applicability to the matter of sensation.

There therefore arises here a difficulty which we did not meet with in the field of sensibility, namely how subjective conditions of thought can have *objective validity*—that is, become conditions of the possibility of the knowledge of objects.

Kant, Critique of Pure Reason (tr. by Max Müller, orig. ed.), p. 89.

II. *n.* 1. In *Eng. gram.*, the objective case; the ease used to express the object of a verb or a preposition. This case answers in most of its uses to the accusative of Greek, Latin, German, and other languages, and is sometimes so called in English. In nouns it is never distinct in form from the subjective or nominative; the only objectives having such a distinct form are the pronominal case-forms *me, thee, him, her, us, them, whom*, corresponding to the nominatives *I, thou, he, she, we, they, you* respectively. Of these, *her* happens to be the same in form as the possessive. When words expressing extent in space or duration in time are put in the objective, they are called *adverbial objectives*: as, he ran a mile; she sang an hour. Compare *cognate object*, under *object*, 5. Abbreviated *obj.*

2. An objective point; especially, the object, point, or place to or toward which a military force is directing its march or its operations.

In 1864 the main *objectives* were Lee's and Johnston's armies, and the critical point was thought to be Richmond or Atlanta, whichever should be longest held. *The Century*, XXXV. 595.

3. The lens, or practically the combination of lenses, which forms the object-glass of an optical instrument, more particularly of the microscope (see *object-glass*). Objectives are generally named from the focal length of a single lens which would have the same magnifying power: as, a two-inch objective or power, a one-half-inch objective (or simply a half), etc. Objectives of high magnifying power and consequently short nominal focal length (e. g., less than half an inch) are often spoken of as *high powers*, in distinction from the *low powers*, which magnify less and have longer nominal focal lengths. Objectives are also characterized as *immersion-objectives* or *dry objectives* according as they are used with or without a drop of liquid between the lens

and the object; if the liquid has sensibly the same refractive power as the glass of the lens, the system is called *homogeneous immersion*. (See *immersion*, 5.) The properties of an objective which determine its value for practical work are—*definition* or *defining power*, depending upon its freedom from spherical and chromatic aberration, which should be accompanied by flatness of field; *penetration*, the power of bringing parts of the object at different levels into focus at once; *resolving power*, the ability (depending upon the size of the aperture and the definition) to exhibit the minute details of structure, as the lines on a diatom frustule (see *test-object*); *working distance*, which is the space separating the lens and the object when the latter is in focus. These properties are in some degree antagonistic: thus, an increase in the aperture, and hence of the resolving power, is accompanied by a decrease in the working distance. The aperture of an objective is often measured by the angle of the cone of rays which it admits, and is then called *angular aperture*. Since, however, this angle varies according as it is used as a dry, water-immersion, or homogeneous-immersion objective, a common measure is obtained, as proposed by Abbe, by taking the product of the half-angle into the refractive index of the medium employed; this is called the *numerical aperture* (sometimes written *N. A.*). Thus, for the maximum air-angle of 180°, which is equivalent to a water-angle of 97° 31' and a balsam-angle of 82° 17', the numerical aperture is unity, while for the respective angles of 60° (air), 44° 10' (water), 38° 24' (balsam), it is 0.5. Again, a numerical aperture of 1.33 corresponds to the maximum water-angle of 150° and a balsam-angle of 122° 6'.—**Endomersion-objective**, a form of objective, or objective-glass, devised by Zeuger, in which the chromatic aberration is removed by the employment of a liquid (as a mixture of ethereal and fatty oils) placed between the separate lenses.

The Greek philosophers alone found little want of a term precisely to express the abstract notion of *objectivity* in its indeterminate universality, which they could apply, as they required it, in any determinate relation. *Sir W. Hamilton* (in Reid), Supplementary Dissertations, [note B, i.

Preponderant *objectivity* seems characteristic of the earlier stages of our consciousness, and the subjective attitude does not become habitual till later in life.

H. Sidgwick, Methods of Ethics, p. 41.

object-soul (ob-jekt-söl), *n.* In *anthropology*, a soul or vital principle believed by many barbarous tribes to animate lifeless objects, and generally imagined as of a phantom-like, attenuated materiality, rather than as of a purely spiritual character.

Specifically—(a) one who devoted himself, his dependents, and estates to the service of some monastery into which he was admitted as a kind of lay brother.

2. *Eccles.*, a loaf of unconsecrated bread prepared for use at the celebration of the eucharist; altar-bread. From the earliest times of which we have distinct information, *oblates* have been circular in form, of moderate thickness, and marked with a cross or crosses. In the Western Church they are unleavened, much reduced in size, and commonly known as *wafers*, or, especially after consecration, as *hosts*. In the Anglican Church the use of leavened bread in loaves of ordinary size and form was permitted at the Reformation, and became the prevalent though not exclusive use. The Greek Church uses a circular oblate of leavened bread, in the center of which is a square projection called the *Holy Lamb*. This projecting part alone is consecrated, and the remainder serves for the antidoron.—*Oblate roll*, in *Eng. hist.*, the account kept in the exchequer, particularly in the reigns of John and Henry III., of old debts due to the king and of gifts made to him.

The act of offering. Specifically, *eccles.*: (a) The donation by the laity of bread and wine for the eucharist, and of other gifts or of contributions in money for the maintenance of divine worship and for the support of the clergy and the poor. In the early church the bread and wine were given by members of the congregation to the deacon before the liturgy, and offered by the priest on the altar; later this custom fell into disuse, and the other gifts were presented at or just before the offertory. The Greek church has a special preparation of the elements in the office of prothesis (see *prothesis*), before the liturgy. (b) The offering or presenting to God upon the altar of the unconsecrated bread and wine; the offertory. (c) The solemn offering or presentation in memorial before God of the consecrated elements as sacramentally the body and blood of Christ. This is called the *great oblation*, in distinction from the *lesser oblation* or offertory. The great oblation forms the second part of the prayer of consecration, the first part being the words of institution, or the consecration in the stricter sense. In the Oriental liturgies, in the Scotch communion office of 1764, and in the American Book of Common Prayer, the great oblation is succeeded by the invocation or epiclesis.

The earliest theory of Liturgies recognised three distinct *Oblations* in the Holy Action.

6. In medieval schools, a rule of disputation by which the opponent was bound to admit any premise, not involving a contradiction, begging of the question, or other fallacy, which the respondent might propose. Disputation, as a game for teaching logic, was a principal part of the scholastic exercises, and perhaps may still be so in some countries. A master presided, and after a sufficient time decided in favor of one of the disputants, who was then obliged to give his adversary a great thwack with a wooden instrument. Act of Oblivion. an English statute of 1660, entitled "An Act of Free and General Pardon, Indemnity, and Oblivion," by which all political offenses committed during the time of the Commonwealth were pardoned, excepting by name certain persons, chief of whom were those engaged in the sentence and execution of Charles I. Also called *Act of Indemnity*. = *Syn. Oblivion, Forgetfulness*.

Obliviousness. *Oblivion* is the state into which a thing passes when it is thoroughly and finally forgotten. The use of the Latin for the act of forgetting was an innovation of the Latinizing age, which has not won recognition, nor has the "Act of Oblivion" given *oblivion* currency in the sense of official or formal pardon. *Forgetfulness* is a quality of a person: as, a man remarkable for his *forgetfulness*. If *forgetfulness* is ever properly used where *oblivion* would serve, it still seems the act of a person: as, to be buried in *forgetfulness*. *Obliviousness* stands for a sort of negative act, a complete failure to remember: as, a person's *obliviousness* of the proprieties of an occasion.

An important musical instrument of the wood wind group, and the type of the family in which the tone is produced by a double reed. In its modern form it consists of a wooden tube of conical bore, made of three joints, the lowest of which is slightly flaring or belled, while the uppermost carries in its end the metal staple with its reeds of cane. The number of finger-holes varies considerably; in the larger varieties they are principally controlled by an intricate system of levers. The extreme compass is nearly three octaves, upward from the B₃ or B₂ next below middle C, including all the semitones. The tone is small, but highly individual and penetrating: it is especially useful for pastoral effects, for plaintive and wailing phrases, and for giving a reedy quality to concerted passages. The normal key (tonality) of the orchestral oboe is C, and music for it is written with the G clef. The oboe has borne various names, such as *chalumeau*, *schalmey*, *shawm*, *bombardo piccolo*, *hautboy*, etc. It has been a regular constituent of the modern orchestra since early in the eighteenth century, and is the instrument usually chosen to give the pitch to others. It has also been used to some extent as a solo instrument. The oboe family of instruments includes the oboe d'amour, the oboe da caccia or tenoroon, the English horn, and the bassoon.

Its normal key was F. The tone was similar to that of the bassoon, but lighter. Also called *tenoroon* and *fagottino*.

=*Syn. 3. Observance, Observation.* These words start from two different senses of the same root—to pay regard to, and to watch. *Observation* is watching or notice; *observance* is keeping, conforming to, or complying with. *Observation* was formerly used in the sense of observance; as, "the *observation* of the Sabbath is again commanded" (caption to Ex. xxxi.); "the opinions which he [Milton] has expressed respecting . . . the *observation* of the Sabbath might, we think, have caused more just surprise" (*Macaulay, Milton*); but this use is now obsolete. In those sciences which describe and explain provinces of the universe as it exists, such as astronomy and systematic biology, observations are, for the most part, made under circumstances or conditions which may be selected, but cannot be produced at will. But in those sciences which analyze the behavior of substances under various conditions it is customary first to place the object to be examined under artificially produced conditions, and then to make an observation upon it. This whole performance, of which the observation is a part, is called an *experiment*. Formerly sciences were divided into sciences of experiment and sciences of observation, meaning observation without experiment. But now experiments are made in all sciences. It is only occasionally that the word *observation* has been used to imply the absence of experimentation.

=*Syn.* 1. *Obstinate, Stubborn, Intractable, Refractory, Contumacious, pertinacious, headstrong, unyielding, dogged, wilful, persistent, immovable, inflexible, firm, resolute.* The first five words now imply a strong and vicious or disobedient refusal to yield, a resolute or unmanageable standing upon one's own will. *Stubborn* is strictly negative: a *stubborn* child will not listen to advice or commands, but perhaps has no definite purpose of his own. *Obstinate* is active: the *obstinate* man will carry out his intention in spite of advice, remonstrance, appeals, or force. The last three of the italicized words imply disobedience to proper authority. *Intractable* literally not to be drawn, handled, or governed, is negative; so is *refractory*: both suggest silliness or perverseness; *refractory* is more appropriate where resistance is physical: hence the extension of the word to apply to metals. *Contumacious* combines pride, haughtiness, or insolence with disobedience; in law it means wilfully disobedient to the orders of a court.

He was a great advocate of the rule of poverty of the Franciscan order, to which he belonged, and a strong defender of the state against the pretensions of the papacy. All his teachings depend upon the logical doctrine that generality belongs only to the significations of signs (such as words). The conceptions of the mind are, according to him, objects in themselves: individual, but naturally significative of classes. These principles are carried into every department of logic, metaphysics, and theology, where their general result is that nothing can be discovered by reason, but all must rest upon faith. Occamism thus prepared the way for the overthrow of scholasticism, by arguing that little of importance to man could be learned by scholastic methods; yet the Occamistic writings exhibit the scholastic faults of triviality, prolixity, and formality in a higher degree than those of any other school.

occlude (o-klūd'), *v. t.*; pret. and pp. *occluded*, ppr. *occluding*. [*< L. occludere* (> F. *occlure*), shut up, close up, < *ob*, before, + *cludere*, shut, close: see *close*, and cf. *conclude*, *exclude*, *include*, etc.] **1.** To shut up; close. [Rare.]

Ginger is the root . . . of an herbaceous plant . . . very common in many parts of India, growing either from root or seed, which in December and January they take up, and, gently dried, roll it up in earth; whereby, *occluding* the pores, they conserve the natural humidity, and so prevent corruption. *Sir T. Browne*, Vulg. Err., ii, 6.

2. In *physics* and *chem.*, to absorb; specifically applied to the absorption of a gas by a metal, such as iron, platinum, or palladium, particularly at a high temperature. Thus, palladium heated to redness and cooled in a current of hydrogen absorbs or *occludes* over 900 times its volume of the gas. By this means the physical properties of the metal are changed, and the occluded hydrogen is regarded as existing in a solid form as a quasi-metal, called *hydruretinum*, the specific heat, specific gravity, and electrical conductivity of which have been approximately determined. Probably a part of the gas forms also a definite chemical compound with the metal. Occluded gases also occur in meteorites. Thus, the Arva meteoric iron yielded (Wright) 47 volumes of the mixed gases carbon dioxide, carbon monoxide, hydrogen, and nitrogen.

Professor Graham has shown its [palladium's] remarkable power of absorbing hydrogen. When a strip of palladium is made the negative electrode in an apparatus for decomposing water, it absorbs 800 or 900 times its volume of hydrogen, expanding perceptibly during the absorption. This *occluded* gas is again given off when the substance, which Professor Graham believed to be an actual alloy of palladium and hydrogen, is heated to redness. *Maudsl.*

occult (o-kult'), a. [= F. *occulte* = Sp. *oculto* = Pg. It. *occulto*, < *L. occultus*, hidden, concealed, secret, obscure, pp. of *occludere*, cover over, hide, conceal, < *ob*, over, before, + **calere*, in secondary form *calare*, hide, conceal: see *cell*, *conceal*.] 1. Not apparent upon mere inspection, nor deducible from what is so apparent, but discoverable only by experimentation; relating to what is thus undiscoverable by mere inspection: opposed to *manifest*. The Latin word was applied in the middle ages to the physical sciences and the properties of bodies to which those sciences relate. Its precise meaning is explained in the treatise "De Magnete" of Petrus Peregrinus. He says that an occult quality is simply one which is made apparent only upon experimentation, but that in that way it becomes as plain and clear as any other quality, and is no more mysterious. By *occult science* or *philosophy* was meant simply experimental science. There were many occult philosophers in northern Europe in the twelfth and the first part of the thirteenth century; but theology so swallowed up other interests that they are all forgotten except Roger Bacon, who was made prominent by the personal friendship of a pope. The ignorance and superstition of the time confounded occult science with magic.

These are manifest qualities, and their causes only are occult. *Newton*, Opticks.

His [Dr. Dee's] personal history may serve as a canvas for the picture of an occult philosopher — his reveries, his ambition, and his calamity.

I. D'Israeli, Amen. of Lit., II. 286.

See *crime*.—*Occult diseases*, in *med.*, those diseases the cause and treatment of which are not understood.—*Occult lines*, such lines as are used in the construction of a drawing, but do not appear in the finished work; also, dotted lines.—*Occult qualities*, those qualities of body or spirit which baffled the investigation of the ancient philosophers, and which were not deducible from manifest qualities, nor discoverable without experimentation.

The Aristotelians gave the name of *occult Qualities* . . . to such Qualities only as they supposed to lie hid in Bodies, and to be the unknown Causes of manifest Effects.

Newton, Opticks (ed. 1721), p. 377.

Occult sciences, the physical sciences of the middle ages; sometimes extended to include magic. See def. 1. = *Syn.* *Latent*, *Covert*, etc. (see *secret*), unrevealed, recondite, abstruse, veiled, shrouded, mystic, cabalistic.

occupancy (ok'ū-pān-si), n. [*< occupant* + *-cy*.] 1. The act of taking possession, or the being in actual possession; more specifically, in *law*, the taking possession of a thing not belonging to any person, and the right acquired by such act; that mode of acquiring property which is founded on the principle that he who takes possession of an ownerless thing, with the design of appropriating it to himself, thereby becomes the owner of it; the act of occupying or holding in actual as distinguished from constructive possession. Formerly, when a man held land *pur autre vie* (for the life of another), and died before that other, as his estate could not descend to his heir nor revert to the donor until the determination of the specified life, it was considered to belong of right to the first who took possession of it for the remainder of the life, and such possession was termed *general occupancy*. And when the gift was to one and his heirs for the life of another, the heir was said to take as *special occupant*. As the law now stands, however, a man is enabled to devise lands held by him *pur autre vie*, and if no such devise be made, and there be no special occupant, it goes to his executors or administrators.

As we before observed that *occupancy* gave the right to the temporary use of the soil, so it is agreed upon all hands that *occupancy* gave also the original right to the permanent property in the substance of the earth itself; which excludes every one else but the owner from the use of it. *Blackstone*, Com., II. i.

2. The term during which one is an occupant: as, during his *occupancy* of the post.

3. *Occupation*, *Calling*, *Vocation*, *Employment*, *Pursuit*, *Business*, *Trade*, *Craft*, *Profession*, *Office*. In regard to what a person does as a regular work or a means of earning a livelihood, *occupation* is that which occupies or takes up his time, strength, and thought; *calling* and *vocation* are high words, indicating that one is called by Providence to a particular line of work; *calling* is Anglo-Saxon and familiar, and *vocation* is Latin and lofty (the words are not always used in the higher sense of divine appointment or the call of duty, but it is much better to save them for the expression of that idea); *employment* is essentially the same as *occupation*; *pursuit* is the line of work which one pursues or follows; *business* suggests something of the management of buying and selling; *trade* and *profession* stand over against each other for the less and more intellectual pursuits, as the *trade* of a carpenter, the *profession* of an architect; *trade* is different from a *trade*, the latter being skill in some handicraft: as, being obliged to learn a *trade*, he chose that of a blacksmith; the "learned *professions*" used to be law, medicine, and the ministry, but the number is now increased; *craft* is an old word for a *trade*; *office* suggests the idea of duties to be performed for others. ocean (o'shan), *n.* and *a.* [*ME. ocean, ocean*, *ocean*, *ocean*, < *OF. ocean*, *ocean*, *ocean*, *ocean*, *F. océan* = *Sp. océano* = *Pg. oceano* = *It. oceano* = *D. ocean* = *G. Sw. Dan. ocean*, < *L. oceanus*, the ocean, < *Gr. ὠκεανός*, orig. (in Homer) the great stream supposed to encompass the earth (also called by Homer ὠκεανός ποταμός, or ῥόος, 'Ocean-stream' (Milton); also personified, Oceanus, the god of the primeval waters; later, the great outward sea, the Atlantic, as distinguished from the inward sea, the Mediterranean; perhaps orig. 'swift,' < ὠκύς, swift.) **I. n.** 1. The body of water which envelops the earth, and covers almost three fourths of its surface with a mean depth—as nearly as can be estimated at the present time—of less than 12,500 feet. Physical geographers, following the lead of the Royal Geographical Society, generally divide the entire oceanic area into five distinct oceans, namely the Arctic, Antarctic, Atlantic, Pacific, and Indian; but these divisions are largely artificial, the lines by which they are indicated being in no small part parallels and meridians. The Arctic and Antarctic oceans, according to this scheme, extend from the north and south poles respectively to the arctic and antarctic circles. The Atlantic extends between the two polar circles, being limited on the east by the land-masses of Europe and Africa and by the meridian extending from Cape Agulhas to the antarctic circle, and on the west by the American land-mass and the meridian of Cape Horn. The Pacific has as its land-limits on the east the American coast, and on the west the Asiatic land-mass, the Philippine Islands, New Guinea, and Australia; its imaginary limits are the meridians of Cape Horn and the South Cape of Tasmania prolonged to meet the antarctic circle. The Indian ocean extends south from the Asiatic mainland to the antarctic circle, its eastern and western imaginary limits having been already given in defining those of the Pacific and Atlantic. Thus, as will be noticed, there are no natural limits on the south of either the Atlantic, the Pacific, or the Indian ocean, since these all unite with the Antarctic ocean to form one continuous area of water. Hence it would be more philosophical to call the vast area of water occupying the chief part of the southern hemisphere the Southern ocean, as has been done by Herschel and Thomson, and to consider the Atlantic, Pacific, and Indian oceans as immense gulfs or prolongations toward the north of the still greater Southern ocean. The Pacific ocean was most generally designated by the older English navigators as the "South Sea," and this name is still current among the Germans. The Atlantic and Pacific are also generally divided into North and South Atlantic and North and South Pacific by the equatorial line. The smaller divisions of the ocean are, in the order of their respective magnitudes, seas, gulfs, bays, sounds, straits, coves, holes, and harbors (see each of these words). The mean depth of the ocean is probably not far from six times the mean elevation of the land above the ocean-level. The deepest soundings of the ocean, however, give figures a little inferior in amount to those indicating the elevation of the very highest mountain-summits. In several different parts of the ocean depths of over 26,000 feet have been sounded, but nowhere as yet has a depth as great as 29,000 feet (the height of Gaurisankar) been reached. (See *deep-sea sounding-machine*, under *deep-sea*.) The oceanic currents are of great importance in their effect on climate. The principal surface current is the equatorial, due to the action of the trade-winds, by which the water is continually urged westward, but, being driven in its westerly course against the land-masses, it is deflected by them, and forced to perform an immense gyration by which it returns into the general system far to the eastward. Owing to the shape of the land-masses in the northern hemisphere, these modifications of the equatorial current are much more distinct and important than they are to the south of the equator. Two of the oceanic currents are especially interesting, the Gulf Stream of the Atlantic and the Kuroshio of the Pacific (see these terms). The surface temperature of the ocean varies greatly in the different latitudes and with the strength and direction of the surface currents, the Gulf Stream playing a most important part in ameliorating the climate of northwestern Europe by means of the heated surface water which it carries from the equatorial regions. Besides these surface currents, however, there is a general exchange of water always going on in the depths of the ocean between the warmer equatorial and the colder polar waters, brought about by the dif-

ference in specific gravity of the two. As the result of this, it is found that the temperature of the ocean as a rule diminishes as greater depths are attained, and that the deeper parts, where open to the general circulation, are near the freezing-point. A remarkable feature of the ocean-water is the uniformity in the nature and quality of the salts which it contains, provided the specimen has been taken at considerable distance from land. The weight of the salts held in solution by the main ocean is about 3 1/2 per cent. of the whole; of this about three quarters is common salt, one tenth chlorid of magnesium, one twentieth sulphate of magnesia, about the same sulphate of lime, one twenty-fifth chlorid of potassium, and a little over one per cent. bromide of sodium. Other substances are also present in smaller quantity, making in all about twenty-nine elements which have been detected in the ocean-water; many of these, however, exist only in very minute traces. The economical value of the ocean as a source of supply for common salt is considerable; but the quantity thus obtained is not so great as that furnished by mines of rock-salt or by the evaporation of brine got by boring. See *salt*.

oceanographic (ō-shē-an-ō-graf'ik), *a.* [*< oceanograph-y* + *-ic*.] Relating to or connected with oceanography. The word is sometimes used in place of *oceanic* when this latter would be more proper. The difference between the two words is but slight, but it would seem that one is used when it is intended to convey a purely geographic idea, the other when the subject is looked at from a more general point of view: as, *oceanographic* phenomena; *oceanic* currents.

oceanographical (ō-shē-an-ō-graf'ī-kāl), *a.* [*< oceanographic* + *-al*.] Same as *oceanographic*.
oceanographically (ō-shē-an-ō-graf'ī-kāl-ī), *adv.* As regards oceanography or the physical geography of the ocean. *Amer. Jour. Sci.*, 3d ser., XXX. 386.

oceanography (ō'shē-ā-nog'ra-fī), *n.* [*< Gr. Ωκεανός*, the ocean, + *-γραφία*, *< γράφω*, write.] The science of the ocean: a special branch of geography. The term *oceanography* is little used in English except by writers translating from the German, who prefer *oceanography* to *thalassography*, while the best authorities writing in English at the present time use *thalassography*, which is a designation of that special branch of physical geography which relates to the ocean and its phenomena.

The cable-laying companies have been the chief contributors to the science of deep-sea research, or *oceanography*.
Nature, XXXVII. 147.

Chemical *oceanography*—a branch of physical geography which has only lately come to be extensively cultivated.
Encyc. Brit., XXI. 611.

oceanology (ō'shē-ā-nol'jī), *n.* [*< Gr. Ωκεανός*, the ocean, + *-λογία*, *< λῆγω*, speak: see *-ology*.] 1. The scientific study of the ocean. See *oceanography*.—2. A treatise on the ocean.

ocellar (ō-sel'ār), *a.* [*< NL. ocellaris*, *< L. ocellus*, a little eye: see *ocellus*.] Of or pertaining to ocelli; ocellate.—**Ocellar structure**, the name given by Rosenbusch to a peculiar aggregation of mineral forms, chiefly microscopic in size, in which the individual components are arranged to rounded (ocellar) forms, or aggregated in branching, fern-like groups, which are sometimes tangential and sometimes radial to the central individual. This structure is most characteristically developed in the leucitophyes. Also called *centric structure* by some English lithologists, by whom this term is used rather vaguely, sometimes as nearly the equivalent of *micropegmatitic*.

The structures which especially distinguish these granophyric rocks are the micropegmatitic, the centric or *ocellar structure*, the pseudospherulitic, the microgranitic, and the drusy or marolithic structures.

Judd, *Quart. Jour. Geol. Soc. of London*, XLV. 176.

ocellary (os'el-ār-ī), *o.* [*As ocellar* + *-y*.] Of or pertaining to ocelli; ocellar.—**Ocellary segments or rings**, in *entom.*, supposed primary segments of the prooral region, the ocelli in this case representing the jointed appendages of other segments. Dr. Packard distinguishes the first and second ocellary segments, which he regards as morphologically the most anterior of the body. He believes that the anterior ocellus represents two appendages which have coalesced. See *prooral*.

ocellate (os'el-āt), *a.* [*< L. ocellatus*, having little eyes, *< ocellus*, a little eye: see *ocellus*.] 1. In *zool.*, same as *ocellated* (c).

The back of the ear is usually black and white, and the tail is half-ringed with black. Individuals vary interminably in the details of the markings, mostly preserving, however, the lengthened figure of the larger spots. The ocelot ranges from Texas into South America. See *cut* on following page.

class of natural earths consisting of mixtures of the hydrated sesquioxides of iron with various earthy materials, principally silicea and alumina. These mixtures occur in many localities and have many shades of color, among which tints of red, reddish brown, yellow, and orange are most common. They form a series of valuable and important pigments, used extensively alike by house-painters and artists both in oil and in water-colors. The most usual and common type of ocher-color is a yellow turning neither to red on the one hand nor to brown on the other, but its tone is not as brilliant nor as pure as chrome-yellow. (For varieties, see below.) Ochers in general have much body and are very permanent. Most ochers on burning become redder and darker. Raw sienna and raw umber are varieties of ocher. 2. Monoy, especially gold coin: so called in allusion to its color. [Slang.]

If you want to cheek us, pay your ochre at the doors.

As a mineral it designates a soft earthy variety of hematite.—**Roman ocher**, a pigment of a rich, deep, and powerful orange-yellow color. It is used, both raw and burnt, in oil and water-color painting, and is transparent and durable.—**Scarlet ocher.** See *red ocher*.—**Stone ocher.** Same as *Oxford ocher*.—**Transparent gold ocher**, an ocher tending toward raw sienna but more yellow in tone.—**Tungstic ocher.** See *tungstite*.

(a) The eighth day from a festival, the feast-day itself being counted as the first: as, Low Sunday is the octave of Easter. The octave necessarily falls on the same day of the week as the feast from which it is counted.

2. In music: (a) A tone on the eighth diatonic degree above or below a given tone; the next higher or lower replicate of a given tone. (b) The interval between any tone and a tone on the eighth degree above or below it. (c) The harmonic combination of two tones at the interval thus described. (d) In a scale, the eighth tone from the bottom, or, more exactly, the tone with which the repetition of the scale begins; the upper key-note or tonic; the eighth: solmized do, like the lower key-note. The typical interval of an octave is that between any tone and its next replicate, which is acoustically represented by the ratio 1:2—that is, in number of vibrations—and is equal to six diatonic whole steps or to twelve semitones. Such an octave is called perfect or major; an octave one half-step shorter is called diminished or minor; an octave one half-step longer is called augmented. The perfect octave is the most complete consonance after the unison. Indeed, its completeness is often regarded as belonging to a different category from that of the other perfect consonances, except the unison, since it amounts rather to a repetition or reinforcement of the original tone at a higher or lower pitch than to a combination of a new or different tone with it: hence the term replicate. In harmony the parallel motion of two voice-parts in perfect octaves is forbidden, except where the mere reinforcement of one voice by another is desired: such octaves are called consecutive octaves. See consecutive intervals, under consecutive.

(e) In a standard system of tones selected for artistic use, a division or section or group of tones an octave long, the limits of which are fixed by reference to a given or assumed standard tone whose exact pitch may be defined. The tone usually assumed as a starting-point is middle C (written on the first ledger line below in the treble clef, and on the first above in the bass clef). The octave beginning on the next C below is called the tenor or small octave; that beginning on the second C below is called the bass or great octave; that beginning on the third C below is called the contrabass octave; while that beginning on middle C itself is called the alto, once-marked, or once-accented octave; that beginning on the next C above is called the treble, twice-marked, or twice-accented octave, etc. See the accompanying table:

Musical notation showing octave divisions. It includes two staves. The top staff shows notes C, D, E, F, G, A, B, c, d, e, f, g, a, b on a single line. The bottom staff shows notes c', d', e', f', g', a', b', c'', d'', e'', f'', g'', a'', b'', c''' on a single line. Labels indicate 'Contrabass octave', 'Bass or great octave', 'Tenor or small octave', 'Alto or once-marked octave', and 'Treble or twice-marked octave'.

The acceptance of the octave as the best unit for thus dividing the series of recognized tones into sections of equal length and value has not been uniform. Ancient Greek music seems to have first used the tetrachord as such a unit; while medieval music employed the hexachord in the same way. The subdivision of the octave portions themselves has also varied greatly in different systems of music. See scale. (f) In organ-building, a stop whose pipes give tones an octave above the normal pitch of the digitals used; specifically, such a stop of the diapason variety. Also known as the principal. Also called octave-flute, octave-stop.—3. Any interval resembling the musical octave in having the vibration-ratio of 1:2.

If . . . the solar spectrum be considered in its whole extent, we find in the ultra red alone, according to Müller, more than two octaves, to which must be added more than another octave from A to the line R in the ultra-violet. The whole length of the solar spectrum thus embraces consequently about four octaves. Lommel, Light (trans.), p. 251.

forte and organ music, a passage of octaves the two tones of which are played successively instead of together: as,

Covered or hidden octaves, in music, the consecutive octaves that are suggested when two voices proceed in similar (not parallel) motion to a perfect octave. Hidden octaves are forbidden in strict counterpoint, and discontinued in simple harmony, particularly if both voices skip. Compare hidden fifths, under fifth.—Rule of the octave, in the musical theory of the seventeenth and eighteenth centuries, an arbitrary and imperfect scheme of the harmonies proper to the successive tones of the scale. The modern theory that every tone of the scale may be made the basis of a triad has completely displaced this rule.—Short octave, in early organ-building, the lowest octave of the keyboard when made to consist of only three or four of the digitals most used in the music of the day, instead of the full number. The digitals were set close together, as if belonging to the regular series. This curtailment was simply to avoid the expense of large pipes.

Having eight leaves to a sheet; formed of sheets of paper so folded as to make eight leaves to the sheet: as, an octavo volume.

II. n. A book or pamphlet every section or gathering of which contains eight leaves, each leaf supposed to be one eighth of the sheet printed: usually written 8vo. When the name of the paper of which the book is made is not specified, an octavo is understood as a medium octavo, 6 x 9 inches. Smaller octavos are—post 8vo, 5 1/2 x 8 1/2 inches; demy 8vo, 5 1/2 x 8 inches; crown 8vo, 5 x 7 1/2 inches; cap 8vo, 4 1/2 x 7 inches. Larger octavos are—royal 8vo, 6 1/2 x 10 inches; superroyal 8vo, 7 x 11 inches; imperial 8vo, 8 1/2 x 11 1/2 inches. These are regular octavo folds of established sizes of paper in the United States. Publishers and booksellers describe as octavos only those books or leaves that are larger than 5 1/2 x 8 and smaller than 7 1/2 x 11 1/2 inches, irrespective of the number of leaves in a section, which may be twelve or sixteen on thin paper and four or six on thick paper. Larger sizes are described as 4to, smaller sizes as 12mo or 16mo. Bibliographers, as a rule, limit the use of the word octavo to books having sections of eight leaves or sixteen pages.

Specifically, a person holding a public office, under a national, state, or municipal government, and authorized thereby to exercise some specific function: as, an officer of the Treasury Department; a custom-house or excise officer; law officers; a court officer. In constitutional provisions and statutes regulating the appointment, tenure, emoluments, etc., of public officers, the designations "officers," "civil officers," "public officers," "executive officers," "judicial officers," "legislative officers," "administrative officers," and the like commonly have in American law peculiar meanings dependent on the connection in which the phrases are used, and on other provisions of law necessary to be considered with them.

Encyc. Brit., XXII. 453.

3. Used absolutely: (a) One who holds a commission in the army or navy. Officers in the navy are distinguished as *commissioned officers*, holding their commissions in the British navy from the lords of the Admiralty and in the United States navy from the President; *arrant officers*, holding warrants in the British navy from the Admiralty, and in the United States navy from the Secretary of the Navy, as boatswains, gunners, carpenters, and sailmakers; and *petty officers*, appointed by the captain or officer commanding the ship. The question would often be determined by a reference to the charter or by-laws of the particular bank. More specifically, in popular use, an *officer* is an executive officer, such as the president, secretary, or treasurer, as distinguished from a member of the board of directors or an employee. (c) A policeman, constable, or beadle.

It is no solecism to call a police-constable an *officer*, although the chief constable would speak of him as one of his "men." A police-constable is a peace officer, with the rights and duties of such, and is therefore entitled to be styled an *officer*. *N. and Q.*, 7th ser., VI. 237.

Hence he has a right to retain the office and receive its compensation. *Cooley*.—**Officer of arms**, in her., one of the officials concerned with heraldry, as a king-at-arms, herald, or pursuivant.—**Officer of the day**, an officer who has charge, for the time being, of the guard, prisoners, and police of a military force or camp, and inspects the guard, messes, barracks, storehouses, corridors, etc.—**Officer of the deck**, the officer who has charge, for the time being, of the management of a ship.—**Officer of the guard**, a commissioned officer who is detailed daily to command the guard. ohm (ôm), n. [*Named after Dr. G. S. Ohm*, the propounder of the law known by his name.] In *elect.*, the unit of resistance (see *resistance*). The theoretical or absolute ohm is equal to 10⁹ centimeter-gram-second units of resistance (see *unit*). The practical ohm, until recently in use, was a resistance equal to that of a certain standard coil of wire (German silver) constructed under the direction of a Committee of the British Association in 1863, and hence often called the *B. A. unit of resistance*; it is a little less (0.987) than the true ohm. The international ohm as defined by the International Electrical Congress of 1893 is: The unit of resistance shall be what is known as the international ohm, which is substantially equal to 1,000,000,000 units of resistance of the centimeter-gram-second system of electromagnetic units, and is represented by the resistance offered to an unvarying electric current by a column of mercury at the temperature of melting ice 14¹/₁₀₀₀ grams in mass, of a constant cross-sectional area, and of the length of 106³/₁₀ centimeters.

ohmad (ô'mad), n. [*< ohm* + *-ad*.] Same as *ohm*.

ohm-ammeter (ôm'am'e-tèr), n. An instrument for electrical measurements: a combination of an ammeter and an ohmmeter.

ohmic (ô'mik), a. [*< ohm* + *-ic*.] Of or pertaining to an ohm or ohms; measuring or measured by the electric unit called an ohm.

At present Dr. Fleming and a few others talk of *ohmic* resistance, to distinguish resistance from the relation between the back electromotive force and the current.

Elect. Rev. (Eng.), XXV. 411. ohmmeter (ôm'mè-tèr), n. [*E. ohm* + *Gr. μέτρον*, measure.] In *elect.*, an instrument by which the resistance of a conductor may be directly measured in ohms.

Examples of the meter are found in the collection of pieces usually published with the poems of Anacreon, and known as *Anacreontics*. Quantity is largely neglected in them.

In the form -ώδης it often implies 'full of,' and seems to associate itself with the series of adjective terminations -ίδης, -ώδης, etc.] A termination of many adjectives (and of nouns thence derived) of Greek origin, meaning 'having the form or resemblance' (often implying an incomplete or imperfect resemblance) of the thing indicated, 'like,' as in *anthropoid*, like man, *crystalloid*, like crystal, *hydroid*, like water, etc. It is much used as an English formative, chiefly in scientific words.

The conidia are ovoid, rather large, and hyaline or pale. They are thought to represent the conidial stages of various *Erythiphæ*. *O. Tuckeri*, the European grape-mildew, which produces only conidia, was thought to be the same as the destructive American grape-mildew, but the latter is now known to produce oospores, and is referred to *Peronospora viticola*. Thirty-five species of *Oidium* are admitted by Saccardo. See *Peronospora*, *grape-mildew*, *grape-rot*, *mildew*, *Erythiphæ*.

It thus appears that all the forms are ult. from the *Gr.*, the *Teut.* (except *Gothic*) and *Celtic* through the *Latin*, and the *Gothic* and older *Slavic* forms directly from the *Greek*.] 1. The general name for a class of bodies which have all or most of the following properties in common: they are neutral bodies having a more or less unctuous feel and viscous consistence, are liquid at ordinary temperatures, are lighter than water, and are insoluble in it, but dissolve in alcohol and more readily in ether, and take fire when heated in air, burning with a luminous smoky flame. The oils are divided into three classes, which have very different chemical composition and properties: the *fatty or fixed oils*, *essential or volatile oils*, and the *mineral oils*. The fatty or fixed oils leave a permanent greasy stain on paper, are distinctly unctuous to the feel, and differ from fats chiefly in being liquid at ordinary temperatures. (See *fat*.) Both are triglycerides of the fatty acids. The fatty oils are of both animal and vegetable origin, and are subdivided into the *drying* and the *non-drying oils*. The former class includes all oils which thicken when exposed to the air through the absorption of oxygen, and are converted thereby into varnish, as, for example, linseed-, nut-, poppy-, and hempseed-oils. The non-drying oils when exposed to the air also undergo a change induced by fermentation, resulting in the formation of acid, disagreeably smelling, acid substances. The fixed vegetable oils are generally prepared by subjecting the seeds of the plant to pressure; the animal oils are, for the most part, the fluid parts of the fat of animals. Fixed oils are used as lubricants, as sources of artificial light, for the manufacture of soaps, and for many other purposes in the arts. Essential or volatile oils are generally obtained by distilling the vegetables which afford them with water; they are acid, caustic, aromatic, and limpid, and are mostly soluble in alcohol, forming essences. They boil at a temperature considerably above that of boiling water, some of them undergoing partial decomposition. Chemically considered, some are pure hydrocarbons (terpenes), but most of them are mixtures of terpenes with certain camphors and resins. They absorb oxygen quite rapidly, producing ozone, which gives to them bleaching properties. They are used chiefly in medicine and perfumery; and a few of them are extensively employed in the arts as vehicles for colors, and in the manufacture of varnishes, especially oil of turpentine. Mineral oils, petroleum and its derivatives, are mixtures of hydrocarbons, some being exclusively paraffins, others containing varying quantities of hydrocarbons of the *ethylene* and *benzene* series. They are only of mineral origin, while the fatty and essential oils are solely of animal and vegetable origin. The mineral oils are now most largely used as sources of artificial light. Oil has been used for religious and ceremonial purposes under Judaism and Christianity as well as in other religions. Under the Mosaic law it was mingled with or poured upon the flour or meal of the offerings at the consecration of priests and Levites, those at the daily sacrifices, etc., and "meat-offerings" (meal-offerings) in general. Kings, priests, and prophets were anointed with oil (whence the title *Messiah* or *Christ*). The oil for the sanctuary and for unction of priests was mixed with myrrh, cinnamon, calamus, and cassia (Ex. xxx. 22-33). In the Christian church anointing inanimate objects with oil signifies hallowing or dedicating them to God, and unction of persons symbolizes the bestowal of the gifts or graces of the Holy Ghost and per-

sonal consecration to God's service. See the phrase *holy oil*, below. For the use of oil in storms at sea, see *oil-distributor*.

oil-distributor (oil' dis-trib' ū- tēr), *n.* Any device or appliance used for the distribution of oil over the surface of the sea for smoothing waves and thus obviating their destructive effect. The first appliance for this purpose, which aimed at economy in the use of oil, was a porous oil-bag attached to a rope, thrown overboard, and towed from the end of a spar or out-

rigger, the oil slowly filtering through the pores. This has been followed by a variety of inventions, comprising oil-bags placed in water-closet pipes, and devices for distributing oil when towed by a vessel. The oil-distributor of M. Gaston Menier employs a pump discharging water at the water-line, through a series of outboard pipes, the pump also taking oil from a receptacle, and mingling it with the water discharged. The rate of expenditure of oil is indicated by a glass gage, and is regulated by a valve. The oil-distributor of Captain Townsend of the United States Signal Office consists of a hollow metal globe ten inches in diameter, which holds about 1½ gallons of oil, and is kept afloat and held in a nearly fixed position relatively to the surface of the water by an air-chamber. The oil-chamber has an upper and a lower valve, both of which may be adjusted to permit water to flow in through the lower, and the oil displaced by the water to flow out through the upper valve, at a rate controlled by the adjustment. The oil acts mechanically by spreading over the surface of the sea in a tenuous film, which is sufficient to prevent the waves from breaking, and this takes from them their chief power for harm.

The fat is first carefully cleaned from adhering impurities, as bits of flesh, etc., and then thor-

oughly washed in cold water. It is next rendered at a temperature of 130 to 175 F., and the mixture of oily products thus obtained is slowly and partially cooled, till a part of the stearin and palmitin has crystallized out. Under great hydraulic pressure the parts which still remain fluid are pressed out; after a time these solidify, and are ready for market. This substance has been largely used as an adulterant of butter. When oleomargarin is churned in a liquid state with a certain proportion of fresh milk, a butter is produced which mixes with it, while the buttermilk imparts a flavor of fresh butter to the mass, making so perfect an imitation that it can scarcely be distinguished by taste from fresh butter. A refined fat strongly resembling that obtained from beef-fat is got from lard by similar treatment. Also, in commerce, called simply *oleo*.

It consists simply of a glass tube, one end of which curves upward, to be inserted into the nostril. A shorter movable cylinder, made of the odoriferous substance, fits over the straight end of this glass tube. On inhaling, no odor will be perceived so long as the outer does not project beyond the inner tube. The further we push forward the outer cylinder, the larger will be the scented surface presented to the in-rushing column of air, and the stronger will be the odor perceived. *Science*, XV. 44.

The olfactory nerves, present in nearly all vertebrates, are slender filaments in man, about twenty in number, arising from the under surface of the olfactory bulb, or terminal part of the rhinencephalon or olfactory lobe. The lobe is primitively hollow, being a tubular process whose cavity is continuous with that of the prosencephalic ventricle, and it is of much greater relative size in the lower than in the higher vertebrates. In the latter the olfactory lobes are reduced to a pair of solid flattened bands, like bits of tape, and improperly receive the name of *olfactory nerves*, which properly applies only to the numerous filaments arising from the bulbous end of the so-called olfactory nerves, penetrating the cribriform plate of the ethmoid bone through numerous minute foramina, and ramifying through the Schneiderian mucous membrane of the nose. Also *olfactive*. See cuts under *Elasmobranchii*, *enkephalon*, *nasal*, and *Petromyzontidae*.—**Olfactory angle**, in *anat.*, the angle formed with the basicranial axis by the plane of the cribriform plate.—**Olfactory bulb**. The rocks classed as Oligocene are partly of fresh-water and brackish origin, and partly marine. They are especially well developed in the Paris basin, in northern Germany (where this name was first proposed by Beyrich), and in Switzerland. The important formation known as the *Molasse* belongs partly to the Oligocene. The vegetation of that period was varied and interesting, and indicative of a decidedly warmer climate than that at present prevailing. Beils referred to the Oligocene extend from Florida through to Texas, and are characterized by the presence of *Orbitoides mantelli*, a widely distributed foraminifer.

The so-called *Oligocene* deposits . . . were originally called by Conrad, who first characterized them, the Vicksburg beds, and by me have been designated the "Orbitoidic," from the great abundance of *Orbitoides Mantelli*, their most distinctive fossil. *Hedberg*, U. S. Tertiary Geol., p. 3.

above and silvery beneath; the general effect is that of an old willow. It is an evergreen, of great longevity and productivity, and thrives in poor and dry calcareous and sandy soils. Of the cultivated variety (O. sativa) some twenty or thirty subvarieties are recognized. The wild variety (O. Olaster) has short blunt leaves, the branches more or less spiny, and a worthless fruit. It is native in southern Europe as well as Asia. The olive was anciently sacred to Pallas, and its leaves were used for victors' wreaths among the Greeks and Romans. (See olive-branch.) The value of the olive lies chiefly in the fruit; but its wood also is valuable. Olivaceum or Lecca-gum (oliva) exudes from the bark, and was formerly used as a stimulant, while the bark itself has served as a tonic.

2. The fruit of the common olive-tree, a small ellipsoid drupe (the "berry"), bluish-black in color when fully ripe. It is an important source of oil (see olive-oil) and is also largely consumed in the form of preserved or pickled olives, consisting of the green-colored unripe drupes, first soaked in water containing potash and lime to expel bitterness, and then bottled in an aromatized salt liquid.

It is an insipid, inodorous, pale-yellow or greenish-yellow, viscid fluid, unctuous to the feel, inflammable, incapable of combining with water, and nearly insoluble in alcohol. It is the lightest of all the fixed oils, and is of the non-drying class. It is very largely used as a food. In countries where it is produced it is employed in cookery and serves as butter with bread; in England and America its table use is chiefly that of a salad-dressing. In medicine it is employed principally in liniments, ointments, and plasters. Inferior grades serve for lubrication, illumination, wooden-dressing, and soap-making. For the best oil the fruit should be picked just before it is ripe enough to fall, and ground at once. The first pressing, without application of water or heat, yields ricin oil. The second pressing, after subjecting the marc to the action of boiling water, is not quite so good; a third yields the inferior pure oil. Olive-oil is extensively adulterated with cotton-seed, arachis, and other oils. Italy leads in the production and export of olive-oil. Also called sweet-oil.

NL. *-ologia*, < Gr. *-λογία*, the terminal part of abstract nouns signifying the being or notion of what is denoted by a compound noun or adjective in *-λογία* (*-ology*) when the verb is taken as active, *-λογία* when it is taken as passive; *-λογία* to be divided *-o-λογία*, < *-o-λογία*, being the final vowel *-o-* of the preceding element, + *-λογία*, the form in deriv. and comp. of *λέγω*, speak, tell, gather, read, = L. *legere*, gather, read (see *legend*), + *-ος*, the nom. term. of an adj. or noun, e. g. *θεολόγος*, *θεο-λόγος*, speaking or one who speaks (discourses or reasons) about God (see *theologian*), *δικολόγος*, speaking or one who speaks (pleads) in a cause, an advocate, *ετυμολόγος*, studying or one who studies the true origin of words, etc., an etymologist; hence *θεολογία*, *δικολογία*, *ετυμολογία*, etc., the being a theologian, advocate, etymologist, etc., or that with which the theologian, advocate, or etymologist, etc., is concerned, theology, forensic pleading, etymology, etc. When the first element is a verb, however, as in *φιλολογία*, < *φιλόλογος*, 'loving words or discourse' or learning (E. *philology*), and in some words in *-ology* < Gr. *-λογία* (as *martyrology*, *menology*, etc.), *λόγος* is directly concerned. Words in *-ology*, *-logy*, are usually accompanied by a noun of agent in *-logus*, *-loger*, *-logian*, or *-logist*, and by adjectives in *-logic*, *-logical*. The second element is prop. *-logy* (*-logue*, etc.), the *-o-* belonging to the preceding element; but the accent makes the apparent element in E. to be *-ology*, which is hence often used as an independent word (see *ology*). In this dictionary the formations in *-ology* not existing in Gr. are reg. explained as "... + *-λογία*, < *λέγειν*, speak," etc., with a ref. to this article, the intervening form *-λογος*, which often does not appear in use, being omitted. 2. F. *-ologie*, etc., < L. *-ologia*, < Gr. *-λογία*, < *-λόγος*, derived in the same manner as above, < *λέγειν*, gather: as, *ἀρθολογία*, the gathering of flowers, < *ἀρθρός*, gathering or one who gathers flowers; *καρπολογία*, the gathering of fruit, < *καρπολόγος*, gathering or one who gathers fruit, etc. See def. 2.] 1. A termination in many words taken from the Greek or formed of Greek elements, especially words denoting a science or department of knowledge. See the etymology.—2. =*Syn.* *Omen*, *Portent*, *Sign*, *Presage*, *Prognostic*, *Augury*, *Foreboding*. *Omen* and *portent* are the most weighty and supernatural of these words. *Omen* and *sign* are likely to refer to that which is more immediate, the others to the more remote. *Omen* and *portent* are external; *presage* and *foreboding* are internal and subjective; the others are either internal or external. *Sign* is the most general. *Prognostic* applies to the prophesying of states of health or kinds of weather, and is the only one of these words that implies a

deduction of effect from the collation of causes. *Presage* and *augury* are generally favorable, *portent* and *foreboding* always unfavorable, the rest either favorable or unfavorable. *Omen* and *augury* are most suggestive of the ancient practice of consulting the gods through priests or augurs. A *foreboding* may be mistaken; the others are presumably correct. All these words have considerable freedom in figurative use. See *foretell*, *v. t.*

An omentum is a structure similar to a mesentery, and is in fact a special mesentery connecting the stomach with the liver, spleen, and colon respectively. Hence omenta are commonly distinguished by name. The *gastrohepatic* or *lesser omentum*, *omentum minus*, is a single fold (two layers) of peritoneum extending between the transverse fissure of the liver and the lesser curvature of the stomach. Between the two layers are the hepatic artery, portal vein, bile-duct, and associate structures, bound together in a quantity of loose connective tissue forming Glisson's capsule. The *gastrosplenic omentum*, of two layers, connects the concavity of the spleen with the fundus of the stomach, and contains the splenic vessels. The *gastrocolic* or *great omentum*, *omentum majus*, also called *epiploon*, is the largest of all the peritoneal duplications, and consists of four layers of peritoneum attached to the greater curvature of the stomach and to the transverse colon, whence it is looped down freely upon the intestines, forming a great flap or apron.

III. pron. 1. A single person or thing; an individual; a person; a thing; somebody; some one; something. It is used as a substitute for a noun designating a person or thing, and is in so far of the nature of a personal pronoun, but is capable, unlike a personal pronoun, of being qualified by an indefinite article, an adjective, or other attributive: as, *such a one*, *what a one*, *a good one*, *each one*, *which one*. It is used in the plural also: as, I have left all the bad *ones*.
Thou thoughtest that I was altogether such an *one* as thyself.
Both were young, and *one* was beautiful.
Lyron, The Dream, ii.

The most frequent constructions of *one* are—(a) As antecedent to a relative pronoun, *one* who being equivalent to *any person* *who*, or to *he* *who*, *she* *who*, without distinction of gender.

(b) As a substitute for a noun used shortly before, avoiding its repetition: as, here are some apples; will you take *one*? this portrait is a fine *one*.

Isa. xlii. 3.

We poor *ones* love, and would have comforts, sir,
As well as great.
Fletcher and Rowley, Maid in the Mill, v. 2.

(d) It easily passes, however, from the meaning 'any one' into the collective sense of 'all persons,' 'people generally,' and for this can be substituted *people*, *they*, *we* (if the speaker does not except himself from the general statement), *you* (the person addressed being taken as an example of others in general), or the impersonal passive may be substituted: as, *one* cannot be too careful (*we* cannot, *you* cannot, *they* cannot, *people* cannot be too careful); *one* knows not when (it is not known when). *One* is sometimes virtually a substitute for the first person, employed by a speaker who does not wish to put himself prominently forward; as, *one* does not like to say so, but it is only too true; *one* tries to do *one's* best. *One's self* or *oneself* is the corresponding reflexive: as, *one* must not *quise one's self*.

One would think it were Mistress Overdone's own house.
Shak, M. for M., iv. 3. 3.

One would not, sure, be frightful when *one's* dead.

The chief supply at the present time, however, comes from Algeria, where it occurs in large quantity and of fine quality. A similar stone, known as *Mexican onyx* or *Teacalli marble*, has been discovered within the past few years in Mexico, and has already come into somewhat extensive use in the United States and elsewhere.

Similar tracts in the more southern States, especially in Kentucky, are called *barrens* and *oak-barrens*.

The trees, with very few exceptions, were what is called the "burr oak," a small variety of a very extensive genus; and the spaces between them, always irregular, and often of singular beauty, have obtained the name of "openings"; the two terms combined giving their appellation to this particular species of native forest, under the name of *Oak Openings*. *J. opera (ōp'e-rā), *n.* [= *F. opéra* = *Sp. P'g. opera* = *D. opera* = *G. oper* = *Sw. Dan. opera*, < *It. opera*, an opera, orig. composition as opposed to improvisation, < *L. opera*, *f.*, work, connected with *opus* (*oper-*), neut., work, toil: see *opus*.] 1. A form of extended dramatic composition in which music is an essential and predominant factor; a musical drama, or a drama in music. The opera is one of the chief forms of musical art; on many grounds it is claimed to be the culminating musical form. At least it affords opportunity for the application of nearly every known resource of musical effect. Its historical beginning was doubtless in the musical declamation of the Greeks, especially in connection with their dramatic representations. The idea of a musical drama was perpetuated during the middle ages under the humble guise of mysteries or miracle-plays, in which singing was an accessory. The modern development began in Italy near the close of the sixteenth century, when an attempt was made to revive the ancient melodic declamation, an attempt which led directly to the discovery and establishment of monody and harmony in the place of the medieval counterpoint, of the recitative and the aria as definite methods of composition, and of instrumentation as an independent element in musical works. The mod-

ern opera involves the following distinct musical constituents, combined in various ways: (a) *recitativo*, musical declamations, mainly epic or dramatic in character, with or without extended accompaniment; (b) *arias, duets, or trios*, melodies for one, two, or three voices, constructed in a more or less strict musical form, predominantly lyrical in character, and usually with carefully elaborated accompaniments; (c) *choruses*, and *concerted numbers* of various form, in which the dramatic element generally predominates, and which are often wrought into noteworthy climaxes of great musical and dramatic interest; (d) *instrumental elements*, including both accompaniments and independent passages, the former varying from the merest harmonic groundwork for declamation to a detailed instrumental commentary upon the dramatic emotions and situations as they succeed each other, and the latter including overtures, intermezzi, marches, dances, etc., which either introduce, connect, supply, or embellish the links in the chain of dramatic incident. To these may be added dancing, or the ballet, which is introduced either as an incidental diversion or as a component part of the dramatic action itself. In the older operas the successive numbers or movements are sharply separated from each other, while in recent ones the action is continuous except at one or two principal points. In Italy the opera has had an unbroken course of development since before 1600. It began to be diligently cultivated in France and Germany about 1650, and in England somewhat later. Every leading modern composer, except Mendelssohn, has contributed more or less to its literature. Italian operas have tended toward a lyrical extreme, to the neglect of dramatic consistency and truth, while German operas have strongly emphasized the romantic and strictly dramatic elements. French operas have often sought much for comic or spectacular effects. The Wagnerian theory of the opera presents some peculiarities, especially in the obliteration of the distinction between the recitative and the formal aria, in the remarkable elaboration of the orchestral effects, and in the unification of the poetic, musical, dramatic, and scenic elements, though these characteristics were foreshadowed in the works and theories of earlier masters. The maintenance of expensive opera-houses, with regular seasons of performances annually, is a matter of governmental appropriation in most European countries. The opera has therefore become a powerful factor in the social and artistic life of many cities. Operas are often described by such qualifying terms as *grand* or *serious*, *dramatic*, *comic*, etc. Grand operas have an elaborate plot, and the entire work is set to music; while comic operas frequently contain spoken dialogue. In common speech, *German opera* means opera in German; *Italian opera*, opera in Italian, etc. A *ballad-opera* is a light dramatic work into which ballads or popular songs are arbitrarily introduced.

An *Opera* is a poetical tale or fiction, represented by vocal and instrumental music, adorned with scenes, machines, and dancing. *Dryden, Albion and Albanians*. Pref.

There are numerous species in the United States, called *king-snakes* and by other names, such as *O. getulus*, *O. sayi*, and *O. eximius*. The form is often slender than in a common eel; the posterior nostrils are labial—that is, are on the margin or even the inside of the upper lip; and the tongue is attached to the floor of the mouth. In some species the tail is conical or finless; in others it is surrounded by a fin, as usual in eels, whence the two subfamilies *Ophichthyinae* and *Myrinae*. Several genera are found in the waters of the southern and Pacific coasts of the United States.

opihcleide (ōf'ī-klid), *n.* [< Gr. *ὄφις*, a serpent, + *κλειδ* (*kleid*), a key: see *claris*.] A metal musical wind-instrument, invented about 1790, having a large tube of conical bore, bent double, with a cupped mouth-piece. It is essentially a development of the old wooden serpent, and has sometimes been made partly of wood: it is the bass representative of the keyed-bugle family. The tones produced are the harmonies of the tube, as in the horn; but the fundamental tone may be altered by means of keys which control vents in the side of the tube. Eleven such keys are employed, so that the entire compass is over three octaves, beginning (in the usual bass variety) on the third B below the middle C, with all the semitones—all obtainable with exceptional accuracy of intonation. Its resources are therefore considerable, and as its tone is highly resonant and pungent it is an important orchestral instrument. The alto *opihcleide* is pitched a fifth higher than that described above, while lower varieties also occur.

Gr. *ὄφιόδερος*, serpent-necked), < *ὄφις*, a serpent, + *δέρω*, Attic *derō*, neck, throat.] The typical genus of *Ophideridae*, having the palpi spatulate or clavate, and the hind wings luteous. It is very widely distributed in both hemispheres. The species are large and often beautifully colored. *O. fullonica* of South Africa damages

Ophideridæ (of-i-dēr'ī-dē), *n. pl.* [NL. (Gueucé, 1852), < *Ophideres* + -idæ.] A family of noctuid moths of large size and striking coloration, represented by *Ophideres* and five other genera in nearly all faune except the European.

Ophidia (ō-fid'ī-ā), *n. pl.* [NL., pl. of **ophidiūm*, < Gr. *ὄφιον*, dim. in form, but not in sense, of *ὄφις*, a serpent; or improp. for **Ophioidæ*, < Gr. *ὄφις*, a serpent, + *ἰδίος*, form.] An order of the class *Reptilia*, without developed limbs, with mobile quadrate bone and separate mandibular rami; the snakes or serpents. The name was introduced to replace *Serpentes* of Linnaeus, and at first included not only serpents in a proper sense, but certain footless lizards, and even the amphibians of the family *Cœciliidae*. In *Ophidia* proper there is never any trace of fore limbs, and at most very rudimentary hind limbs, represented externally by mere anal spurs or processes of the integument. There is no sternum. The ribs are very numerous, and are so arranged as to become indirect organs of locomotion by their action upon the skin and so on the scales of the belly. The vertebrae are procelous, very numerous, not united in any sacrum, and bearing no chevron-bones. The skull has no quadratojugal arch nor parietal foramen; the lower jaw is articulated with a movable quadrate bone, and its ram are connected only by fibrous tissue. The bones of both jaws are generally freely movable, so that the mouth is enormously distensible. The tongue is slender, forked, and protrusile, subserving a tactile office. Teeth are present in one or both jaws, usually in both; they are numerous and sharp, and in venomous *Ophidia* some of the upper ones, usually a single pair, are enlarged, hooked, grooved, or apparently perforate, and thus converted into poison-fangs. The eyes have no movable lids, the cuticle extending directly over the eyeball. The cuticle is scaly, forming many very regularly arranged rows of scales on the upper parts, and usually larger modified scutes on the under side, called *gastrosteges* and *urosteges*, serving to some extent for locomotion. There is a pair of extracloacal penes in the male; the female is oviparous or ooviviparous. *Ophidia* are variously subdivided—by Duméril and Bibron into *Ophierodonta*, *Alyphodonta*, *Proteroglyphæ*, and *Selenoglyphæ*, an arrangement substantially now current, though with some modifications. Cope's latest arrangement is *Epanodonta*, *Catodonta*, *Tortricina*, which are *opoterodonta*, *Ainæa*, which are *aglyphodonta*, *Proteroglyphæ*, and *Selenoglyphæ*. There are 20 families and about 300 genera, of which more than 200 belong to the family *Colubridæ* alone. See also cut under *Python*.

(1) *In Bonaparte's* early systems the *Ophidiidæ* embraced two subfamilies, *Ophidiini* and *Ammodiini*. (2) *In Günther's* system they are a family of gadoid fishes corresponding to the modern *Ophidioidæ*. (3) *In Gill's* system the family is restricted to those *Ophidioidæ* which have the ventral fins under the chin, hind barbels, and the anus in the anterior half of the length of the fish, represented by four genera. There is but one species, *O. paradoxum*, the snakesnut-tree, native in Guiana, a lofty tree bearing alternate pinnate leaves, panicles of many very small flowers, and roundish one-seeded drupes containing a spirally twisted snake-like embryo. The natives are said to believe that these are transformed into venomous serpents.

Ophiocephalidæ (of'i-ō-se-fal'i-dē), *n. pl.* [NL., < *Ophiocephalus* + *-idæ*.] A family of fishes, typified by the genus *Ophiocephalus*; the walking-fishes. They have a long subcylindric body covered with small scales, and a snake-like head shielded on top with large scales, a long spineless dorsal fin, and usually six-rayed thoracic ventrals. These remarkable fishes breathe air by means of an air-chamber developed over the gills, and die if they breathe water too long. They live in holes in the banks of rivers and pools and similar wet places, and often burrow in the mud. There are 25 or 30 species, natives of the fresh waters of the East Indies and Africa, and some attain a length of from 2 to 4 feet. They are able to survive droughts, living in semi-fluid mud or lying torpid below the hard-baked crust of a tank or pond from which every drop of water has dried up. Respiration is probably suspended during this torpidity, but while the mud is still soft enough to let them come to the surface they rise at intervals to breathe air. This faculty of aerial respiration is due to the development of the accessory branchial chamber; there is, however, no accessory branchial organ, and the opening of the cavity is partly closed by a fold of mucous membrane.

The species are natives of the East. They are furnished with a cavity to supply water to the gills, and are able to live a long time out of water, and often travel considerable distances from one pool to another. The *O. gachua* (the *coranota* or *gachua* of India) is much used for food by the natives. It is generally brought to market and cut up for sale while living. Also, improperly, *Ophiocephalus*. Bloch and Schneider, 1801.

It is esteemed for the table, and is known by various names, as *bastard cod*, *cultus-cod*, *green-cod*, *buffalo-cod*, and *codfish*. See *cut* under *cultus-cod*.

the leaves are not circinate in veneration, and the sporangia, which are endogenous in their origin and without annulus, are never borne on the under side of the green frond. They differ further from the true ferns by the absence or imperfect formation of bundle-sheaths and selerenchyma in the stems and leaves. The *Ophioglossaceæ* embrace 3 genera, *Ophioglossum*, *Helminthostachys*, and *Botrychium*.

Ophioglossæ (of'i-ō-glos'ē-ē), *n. pl.* [NL., < *Ophioglossum* + *-æ*.] Same as *Ophioglossaceæ*.

hymenopterous insects, founded by Fabricius in 1798, belonging to the family *Ichneumonidæ*, and typical of the subfamily *Ophiouina*.

The antennæ are as long as the body, the abdomen is compressed, and the color is usually honey-yellow. *O. macrurum* infests the American silkworm, *Teia polyphemus*. The female lays one egg in the body of the silkworm, which latter lives till it is full-grown and spins its cocoon, but then dies without pupating. *O. purgatum* infests the common army-worm, or larva of *Leucania unipuncta*.

It is chiefly characterized by the compressed, usually petiolate abdomen and short ovipositor. It includes about 50 genera besides *Ophion*, and many hundred species. Not are all snakes of such imposing qualities as common opinion presumeth: as is confirmable from the ordinary green snake with us, from several histories of domestic snakes, from *ophiophagous* nations, and such as feed upon serpents. Sir T. Browne, Vulg. Err., vi. 28.

Ophiophagus (of-i-ōf'ā-gus), *n.* [NL., < Gr. ὄφιόφαγος, serpent-eating: see *ophiophagous*.] A genus of very venomous serpents of the family *Elapidæ*, or of the restricted family *Najadæ*. It is a kind of cobra, very closely related to *Naja*, the chief technical distinction being the presence of postparietal plates on the head. *O. elaps*, the hamadryad, is one of the largest and most deadly of serpents: it is known to attain a length of nearly 12 feet, and is said to reach 15 feet. Its bite is fatal to man in a few moments, and it is said to be able to kill very large quadrupeds. This serpent is found in India and some of the East India islands, as Java, Sumatra, and Borneo, but is fortunately not so common as the ordinary cobra. The generic name refers to its habit of feeding upon other snakes.

Ophiopogon (of'i-ō-pō-gon), *n.* [NL. (Aiton, 1789), < Gr. ὄφις, snake, + πῶγον, beard.] A genus of monocotyledonous plants of the order *Hamodoraceæ*, type of the tribe *Ophiopogoneæ*, characterized by separate filaments shorter than the linear anthers. ophite¹ (of 'it), *n.* [< Gr. ὄφιτης, of or like a serpent, < ὄφις, a serpent.] Pertaining to a serpent.

ophite² (of 'it), *n.* [< L. *ophites*, also *ophitis*, serpentine stone (see *ophites*), < Gr. ὄφιτης, fem. ὄφίτις, of or like a serpent; see *ophite*¹, a.] A name originally applied to certain eruptive (diabasic or doleritic) rocks occurring in the Pyrenees, and later used with similar meaning for rocks found in Spain, Portugal, and northern Africa. In many of these the augite has become converted into malinite, hence they had previously been often classed with the diorites. Michel Lévy divides the French ophites into two types, the first distinguished by the presence of large proportions of the augitic or uraltic constituent, the second by a large predominance of plagioclase. The composition of the rocks which have been designated by different lithologists as *ophites* is variable, and their relations have not yet been fully worked out.

Ophite² (of 'it), *n.* [< LL. *Ophitæ*, < LGr. ὄφίται (also ὄφαινοί), pl., < Gr. ὄφιτης, of or pertaining to a serpent; see *ophite*¹, n.] A member of a Gnostic body, of very early origin, especially prominent in the second century, and existing as late as the sixth century. Its members were so called because they held that the serpent by which Eve was tempted was the impersonation of divine wisdom, the great teacher and civilizer of the human race. They were also called *Naassenes* (from Hebrew *nāchāsh*, a serpent). See *Sethian*.

ophites (ō-fī'tēz), *n.* [L., < Gr. ὄφιτης (see ἴδιος), serpentine stone, so called, according to Pliny, because it is spotted like a snake, or, as was fancifully thought, because a person carrying it might walk among serpents with impunity; see *ophite*¹.] A stone mentioned by various Greek and Latin authors, the word designating several quite different things. It is impossible to identify with certainty any one of the various substances, some of which were unquestionably fabulous, to which the name *ophites* was given by Orpheus, Dioscorides, Pliny, and other classic writers. Pliny distinguishes two kinds of ophite, the hard and the soft. The former may have been some variety of granite; the latter, a variety of serpentine, perhaps the Tuscan gabbro or ophiolite. From a very early time, various rounded stones or petrifications, more or less egg-shaped in form, and called by various names, *ovum anguinum*, *ophites*, *serpent-stone*, *adder-head*, *Druidical bead*, etc., have been held in high veneration, and endowed with extraordinary virtues. The *ovum anguinum* described by Pliny would appear from his description to have been a fossil echinoderm. Glass spindle-whorls, which are known to have been in use within the past four hundred years, have been sold at a recent day as the true *ovum anguinum*; and fossil echinoderms have also been within a few years treasured as Druidical relics, and regarded as possibly possessing a portion, at least, of the virtues attributed by the ancients to the ophites.

ophitic (ō-fī'tik), *a.* [< *ophite*¹ + *-ic*.] An epithet applied by various lithologists to a structure, especially characteristic of certain diabases and dolerites, in which the augitic constituent is separated into thin plates by interposed lath-shaped crystals of plagioclase, although the identity of the augitic crystal is not lost, as is shown by the similar optic orientation of the separated portions.

Ophiuchus (of-i-ū'kus), *n.* [L., < Gr. ὄφιούχος (tr. by L. *Anguiterius* as well as *Serpentarius*), a constellation so called, lit. 'holding a serpent.' < ὄφις, a serpent, + ἔχω, hold; see *hectic*.] An ancient northern constellation, representing a

man holding a serpent; the Serpent-bearer. Also called *Serpentarius*. The Serpent is now treated as a separate constellation.

Incensed with indignation, Satan stood
Interfited, and like a comet burn'd,
That fires the length of *Ophiuchus* huge
In the arctic sky. Milton, P. L., ll. 709.

Ophiura (of-i-ū'rā), *n.* [NL., < Gr. ὄφιούρος, serpent-tailed, < ὄφις, a serpent, + οὐρά, a tail.] A genus of sand-stars or brittle-stars, variously restricted by different authors. The term is used with great latitude of definition, and gives name to a family and to the whole order to which it belongs. In the late most restricted sense it is discarded, and *Ophiiderma* is substituted, giving name to a family *Ophiidermatidæ*.

ophiuran (of-i-ū'ran), *a. and n.* I. *a.* Of or pertaining to the genus *Ophiura* in any sense, or to the order *Ophiuroidea*.

II. *n.* A member of the *Ophiuroidea*.

Ophiuridæ (of-i-ū'ri-dē), *n. pl.* [NL., < *Ophiura* + *-idæ*.] A group of ophiurans. (a) In the widest sense, the whole order *Ophiuroidea*. (b) In a middle sense, the ordinary ophiurans with simple arms. (c) In the narrowest sense, the family represented by *Ophiura* or *Ophiiderma*, and now called *Ophiidermatidæ*. See cut under *Astrophyton*.

ophiuroid (of-i-ū'roid), *a. and n.* [< NL. *Ophiura* + *-oid*.] I. *a.* Ophiuran in the widest sense; of or pertaining to the order *Ophiuroidea*.

II. *n.* An ophiuran; any member of the *Ophiuroidea*.

Ophiuroidea (of'i-ū-ro'i'dē-ū), *n. pl.* [NL., < *Ophiura* + *-oidæa*.] An order of echinoderms of the class *Stellerida* or starfishes, containing the brittle-stars, sand-stars, or ophiurans. They are starfishes with a more or less well-defined central disk distinct from and not passing into the arms or rays, and no anal orifice. The axis of the arms is composed of a series of calcareous ossicles called *vertebræ*, each of which is composed of two parts representing the ambulacral plates of ordinary starfishes, and the axis is covered with plates or with continuous integument, usually bearing spines. The ambulacral nerve, water-vessels, and neural canal are within the hollow of the arm. The water-fret or pedicles are without suckers or ampullæ, and protrude between the lateral plates of the arms. The mouth is pentagonal, and each angle is composed of five pieces. The order falls naturally into two leading divisions, according as the arms are simple or branched. These are sometimes called families, *Ophiuridæ* and *Astrophytidæ*; sometimes they are considered as suborders, when the former group is known as *Ophiurida* or *Ophiurææ*, and further subdivided into several families, of which the *Ophiuridæ* proper constitute one. = *Syn.* The uses of *Ophiura* and its derivatives are almost inextricably blended; but in general (a) *Ophiuroidea* or *Ophiuridæ* or *Ophiurææ* or *Ophiuroidea* are the major terms of the series, naming the whole group of ophiurans; (b) *Ophiurida*, *Ophiuridæ*, *Ophiurææ*, *Ophiurææ*, *Ophiurææ* are middle terms designating the simple ophiurans as distinguished from the euryalæans or *Astrophytidæ*; and (c) *Ophiuridæ* is the minor term, designating a restricted family.

(Lindley, 1826), < *Ophrys* (stem taken to be *Ophryd-*) + *-ææ*.] A tribe of orchids, distinguished by the anther-cells being adnate to the top of the column and often continuous with the beak of the stigma. It includes 33 genera, especially of southern Africa, of which *Ophrys* is the type, and *Orchis*, *Habenaria*, and *Disa* are the best-known, all terrestrial, with the roots a cluster of thickened fibers, producing an annual unbranched leafy stem, with a terminal spike or raceme of bracted flowers. See *poppy* and *Papaver*. The opium exudes as a milky juice from shallow incisions made in the partly ripened capsules or heads still on the plant. It soon thickens, is collected by scraping and kneaded into a homogeneous mass, forming then a reddish-brown sticky gum-like substance of bitter taste and peculiar odor. Opium was known to the Greeks, but was not much used before the seventeenth century; at present it is the most important of all medicines, and its applications the most multifarious, the chief of them being for the relief of pain and the production of sleep. Its habitual use is disastrous and difficult to break up. It is classed as a stimulant narcotic, acting almost exclusively on the central nervous system when taken internally; in large quantities it is a powerful narcotic poison, resulting in a coma characterized by great contraction of the pupils, insensibility, and death. The chief active principle of opium is morphia, but it also contains at least sixteen other alkaloids, some of which have similar properties. (See *narcotine*.) Though opium can be produced in Europe, the United States, etc., its commercial production is limited to countries where labor is cheap and the drug in common use, namely Turkey, Persia, Egypt, India, and China. The Western market is supplied largely from Asia Minor. The Indian export goes chiefly to China.

opossum (ō-pos'um), *n.* [Formerly also *opossum*; also, and still in rural use, abbr. *possum*, formerly *possoone*; Amer. Ind.] 1. An American marsupial mammal of the family *Didelphidae* (which see for technical characters). They have the four kinds of teeth which carnivorous quadrupeds regularly possess (incisors, canines, premolars, and molars), and are omnivorous, eating flesh and carrion, reptiles, insects, and fruits. The head is conical, and the snout somewhat resembles that of a pig; the ears are large, leafy, and rounded; the eyes are small; the whiskers are long; the legs are of proportionate length; both fore and hind paws are five-toed, fashioned like hands, especially the hind ones, which have an opposable thumb; and the tail is generally long, scaly, and prehensile, so that the animal can hang by it. The pelage is coarse; the body is stout, and in size ranges from that of a large cat to that of a small rat. Most female opossums have on the belly a pouch containing the teats, into which the young are received as soon as they are born. They are born extremely small and imperfect. The Virginia opossum has 13 teats, and no doubt may have as many young at a birth, but the number is usually less. Opossums are nocturnal animals; they move on the ground rather slowly and awkwardly, but are more at home in trees, and some of the species are aquatic. Though they are uncleanly, the flesh is white and palatable, especially in the autumn, when they feed much on fruits, and become as fat as pigs. They commonly appear stupid, and in confinement continue sullen and intractable. When caught or threatened with danger they feign death, and will submit to the most brutal maltreatment without showing a sign of animation, whence the proverbial expression "to play possum." Most opossums belong to the genus *Didelphys*, ranging from middle latitudes in the United States through the greater part of South America. The commonest and best-known is *D. virginiana*. There are perhaps a dozen others, among them pouchless ones, as *D. dorsigera*. The yapoks or water-opossums of South America form another genus, *Chironectes*.

Common Opossum (*Didelphys virginiana*).

Amongst the Beasts in Virginia there are two kinds most strange. One of them is the Female *Possoone*, which

bath a bag under her belly, out of which she will let forth her young ones, and take them in again at her pleasure. The other is the flying Squirrel.

(c) The angle between the optic axes in a biaxial crystal.—**Optic axis.** (a) See *axial*. (b) The line in a doubly refracting crystal in the direction of which no double refraction occurs. Crystals belonging to the tetragonal and hexagonal systems have a single optic axis, coincident with their vertical crystallographical axis: hence they are said to be *uniaxial*. Crystals belonging to the orthorhombic, monoclinic, and triclinic systems have two optic axes, and hence are *biaxial*.—**Optic chiasm**, in *anat.*, the commissure, decussation, or chiasm of the right and left optic nerves. tute what are called in human anatomy the *nates* and *testes* of the brain. The optic nerves arise in part from the optic lobes. These important lobes decrease in relative size as the vertebrate scale ascends; thus, in some fishes they are quite as large as the cerebral hemispheres, and lie uncovered upon the surface of the brain; they are quite large in reptiles and birds; small in mammals (in man smallest in proportion both to the cerebrum and to the cerebellum), and entirely covered in, so that they do not appear upon the surface of the brain. See cuts under *cerebral* and *corpus*.—**Optic nerves** (*nervi optici*), the nerves of sight; the nerves of the special sense of vision, arising from the anterior quadrigeminal and external geniculate bodies and the pulvinar, and terminating in the retina. These nerves are purely sensory, and by means of them the retinal stimulations affect the brain—a process by which vision is accomplished. The optic nerves of opposite sides decussate or form the optic chiasm, and the phrase is sometimes restricted to the part of these nervous trunks beyond the chiasm, the rest being called the *optic tract*. See cuts under *brain*, *corpus*, and *eye*.—**Optic neuritis**. See *neuritis*, and cuts under *corpus* and *eye*.—**Optic pad**, a pad-like elevation at the end of the arms of a starfish on which an eye is situated.—**Optic papilla**. See *Stylomatophora*.—**Optic thalamus**, a large ganglion of the thalamencephalon, situated upon the crus and separated from the lenticular nucleus by the internal capsule. It gives origin to some of the fibers of the optic nerve. Also called *thalamus*. See cuts under *cerebral* and *corpus*.—**Optic tract** (*tractus optici*), the part of the whole course of the optic nerves which is between the chiasm and the respective origins of the nerves. In man the tracts are narrow flat bands of white nerve-tissue crossing the crura, to which they are closely attached.—**Optic tubercles**, the corpora quadrigemina. See *bigemnum*.—**Optic vesicles**, in *embryol.*, a pair of vesicles developed from the anterior cerebral vesicles of the embryonic brain.—**Syn.** *Optic, Optical*. The former is chiefly said of the anatomy of the eye and of the physiology of vision, the latter chiefly of the science of optics: as, *optic nerve*, *tract*, *lobe*; *optical angle*, *center*, *effect*.

Boyle, *Works*, I. 673.—**Optical anomaly**. See *anomaly*.—**Optical center**, in a lens, a point so situated that the direction of every ray passing through that point remains unaffected by its transmission through the lens—that is, the incident and emergent parts of the ray are parallel. Geometrically it is defined as the point in which the optical axis of the lens is cut by the line joining the two points where any pair of parallel planes touch the opposite surfaces of the lens. In a double-convex or double-concave lens the optical center lies within the lens; in a plano-convex or plano-concave lens it is the point where the curved surface of the lens is pierced by the axis; in the meniscus and concavo-convex it lies outside of the lens, beyond the surface which is most strongly curved. If the thickness of the lens is small compared with its focal length, the dimensions of object and image will be very nearly proportional to their distances from the optical center. Combinations of several lenses do not possess an optical center.—**Optical circle**, in *physics*, a graduated circle, fitted with the necessary appliances, used for illustrating the laws of refraction and reflection, or, when accurately constructed, for measuring interfacial angles, refractive indices, etc.—**Optical densimeter**, *equation*, *glass*, *meteorology*, *square*, etc. See the nouns.—**Syn.** See *optic*.

See *geometric*.—**Physical optics**, that branch of optics which includes the phenomena of diffraction, interference, double refraction, and in general that division of the subject which is explained by reference to the undulating theory and the behavior of light-waves under various conditions.—**Physiological optics**, that branch of physiology which treats of the eye and the sight-function.

Between the eye and the speculum is a piece of parallel-faced glass with a small dot on its center, exactly in the focus of the eye-glass. This dot is made to pass over the outlines of an object, and a pencil fixed at the eye-end traces the delineation on paper.

Option, Choice, Preference, Election*. *Option* is the right of choice, the freedom to choose between two or more: as, "there is no *option*," *Shedd*, *Homiletics*, p. 30. *Choice* is primarily the act of choosing, but, by extension, may be the same as *option*: as, he gave him the *choice*. *Preference* is primarily the state of mind determining the choice, and sec-

ondarily the act of choosing. *Election* emphasizes the leaving of some while choosing others. *Chance* and *preference* may apply to that which is chosen; the others not. **optional** (op'shon-al), *a.* and *n.* [*< option + -al.*] **I. a. 1.** Left to one's option or choice; depending on choice or preference.

optostriate (op-tō-strī-āt), *a.* [*< Gr. ὀπτα(ικός), of seeing, + E. striate.*] Pertaining to or consisting of the striate thalamus and the striate body: as, the *optostriate* body (the thalamus and the corpus striatum taken together).

Sun'd itself on his breast and his hands.
Tennyson, Maud, xiii.

Syn. *Opulence, Wealth, Riches, Affluence.* All these words imply not only the possession of much property, but the possession of it under such circumstances that it can be and is enjoyed. They seem contrasted not only with their opposites, but with the possession of a moderate amount. *Opulence* is a dignified and strong word for *wealth*. *Wealth* and *riches* may mean the property possessed, and *riches* generally does mean it; the others do not. *Affluence* suggests the flow of wealth to one, and resulting free expenditure for objects of desire. There is little difference in the strength of the words.

There are about 200 species, of warmer America, with one species widely scattered throughout the Old World. They are fleshy herbs, shrubby plants, or sometimes trees, their branches usually flattened or globose joints, with hairy tubercles which are set with sharp spines. They bear small scale-like leaves on the younger branches, lateral yellow, red, or purple flowers, and pear-shaped berries. (Bentham and Hooker, 1865), < Opuntia + -ea.*] A tribe of polypetalous plants of the order *Cactaceae*, distinguished by the short calyx-tube, not prolonged beyond the ovary. It contains 4 genera, of which *Opuntia* is the type and only important one, and about 250 species, principally American. They are succulent perennials, shrubs or sometimes trees, armed with sharp spines. Their usually lateral and large flowers are followed by pear-shaped or roundish berries. See cut under *Opuntia*.

opus (ō'pus), *n.*; *pl. opera* (op'ē-rā). [*L., work, a work: see opera.*] Work; a work, as a literary or musical composition (in the latter use often abbreviated *op.*). course fall in the middle of the blocks of the courses immediately above and below.—**Opus intarsiale**, decoration produced by cutting away the ground, leaving the pattern, or cutting out the pattern, so that the openings form the design.—**Opus lateritium**, in *ancient masonry*, brickwork or tilework.—**Opus magnum** or **magnum opus**, a great work; a literary or artistic work on which one spends his best powers.—**Opus musivum**, mosaic.—**Opus operantis**, literally, the work of the worker; in *theol.*, the effect of a sacrament considered as proceeding from the spiritual disposition or condition of the recipient. The doctrine that the sacraments confer benefits *ex opere operantis*, from the act of the person acting or taking part in them, is regarded as a distinctively Protestant view, in opposition to the doctrine that the benefit is derived *ex opere operato*.—**Opus operatum**, literally, a work wrought; in *scholastic and Roman Catholic theology*, the due celebration of a sacrament, considered as necessarily and inherently involving the grace of the sacrament. Sacramental grace is said by Roman Catholic theologians to be conferred *ex opere operato*, 'from the (sacramental) act performed,' the sacrament deriving its power from the institution of Christ, and not from the merit of the minister or recipient. Sacraments

are therefore viewed as conveying grace to the recipient, unless by want of the due dispositions, such as faith, love, repentance, etc., he willfully interposes a barrier which prevents his receiving the grace. Certain schoolmen are thought to have taught that the sacraments produce their full effect in all cases without restriction, and this doctrine has often been imputed by Protestant controversialists to the Roman Catholic Church, instead of that contained in the decrees of the Council of Trent (session vii., canon viii.) as explained by Bellarmine and others, and given above. Anglican theologians have sometimes used this phrase to express the doctrine of the Church of England that the inward grace is one of the two integral parts of a sacrament (Catechism), that the sacraments are signs which are effectual (Article xxv.), and that, as the English bishops declared at the Savoy conference, "sacraments have their effects where the receiver doth not 'ponere obicent', put any bar against them." *Procter, Book of Common Prayer* (Amer. ed.), p. 124.—**Opus phrygium**, in the middle ages, embroidery. Compare *Phrygian work* (under *Phrygian*) and *auriphrygia*.—**Opus plumarium**, an old name for *feather-stitch*.—**Opus punctatum**. Same as *pointed work*.—**Opus reticulatum**, in *masonry*, regular stonework or brickwork in square blocks, the courses of which are inclined at an angle of 45° to the horizon, so that the joints resemble a network.—**Opus Saracenicum**, Saracenic work (that is, tapestry, rugs, etc.), imported from the East.—**Opus sectile**, a kind of pavement formed of slabs or tiles of glass or other material, the pieces having a definite size, far larger than the tesserae of ordinary mosaic. They are sometimes of plain color and sometimes mottled and veined.—**Opus signinum**, a kind of tough cement or stucco used by the ancient Romans to coat the interior of aqueducts, etc.—**Opus spicatum**, herring-bone masonry.—**Opus tessellatum**, a pavement with designs executed in pieces of different colors, called *tesserae* or *tessellae*, of larger size and more regular form than the pieces used in mosaic.

culo, < L. *oraculum*, syncopated *oroelium*, a divine announcement, a prophecy, a place where such were given, < *orare*, pray: see *oration*.] 1. In *class. antiq.*: (a) An utterance given by a priest or priestess of a god, in the name of the god and, as was believed, by his inspiration, in answer to a human inquiry, usually respecting some future event, as the success of an enterprise or battle, or some proposed line of conduct. Such oracles exerted for centuries a strong influence upon the course of human affairs, the belief of both the medium and the questioner in their divine inspiration being in most cases genuine. The oracles themselves, however, were often ambiguous or at least obscure. The prestige of the chief oracular seats of Greece was powerful in the promotion of good government and justice. After the introduction of Christianity the utterance of oracles gradually ceased. It was a common belief of early Christians that the oracles actually proceeded from evil spirits.

Though I am satisfied and need no more
Than what I know, yet shall the oracle
Give rest to the minds of others.
Shak., W. T., li. 1. 190.

(b) The deity who was supposed to give such answers to inquiries.

No voice or hideous hum
Runs thro' the arched roof in words deceiving.
Milton, Nativity, l. 173.

Oracles are brief and final in their utterances.
O. W. Holmes, Emerson, iv.

(c) The place where oracular answers were given; the sanctuary, temple, or adytum whence the supposed supernatural responses proceeded. The Greeks surpassed every other nation in both the number and the celebrity of their oracles. Those of Zeus at Dodona in Epirus, of Apollo at Delphi, and of Trophonius near Lebadeia in Boeotia enjoyed the highest reputation.

Thither come,
And let my grave-stone be your oracle.
Shak., T. of A., v. 1. 232.

2. Hence, by extension—(a) The communications, revelations, or instruction delivered by God to or through his prophets: rarely used in the singular: as, the *oracles* of God; the divine *oracles*.

This is he . . . who received the lively *oracles* to give unto us.
Acts vii. 38.

They presume that the law doth speak with all indifference: that the law hath no side-respect to their persons; that the law is, as it were, an *oracle* proceeded from wisdom and understanding.
Hooker, Eccles. Polity, i. 10.

(b) The sanctuary or most holy place in the temple, in which was deposited the ark of the covenant (1 Ki. vi. 19): sometimes used for the temple itself.

The priests brought in the ark of the covenant of the Lord unto his place, into the *oracle* of the house, to the most holy place, even under the wings of the cherubims.
1 Ki. viii. 6.

There are three principal varieties of the orange—the sweet or China orange, *Citrus Aurantium* proper, including the ordinary market sorts; the bitter or Seville orange or bigarade, variety *Diyaradia*, used for making marmalade, its peel being specially valued; and the bergamot orange, variety *Bergamita*, classed by some, however, as a variety of *Citrus Medica* (see *bergamot*), 1). 2. Its flowers are prized when fresh (see *orange-blossom*), and chiefly those of the bitter orange yield neroli-oil and orange-water. The varieties of the orange are very numerous, distinguished most obviously by their fruit. Its origin is referred to India, whence it spread to western Asia, thence reaching Spain and Italy, through the agency of the Moors and the crusaders, between the eleventh and fourteenth centuries. It is now cultivated in nearly all tropical and subtropical lands, including China and Japan, the whole Mediterranean basin, the West Indies, and the southern borders of the United States, having, indeed, become thoroughly wild in Florida.

very different from those of man, in whom the height and the reach of the arms are nearly the same. The arms of the orang-utan reach nearly to the ground when the animal stands erect. This attitude is difficult and constrained, and is not ordinarily assumed. The animal is most at home in trees, where it displays extraordinary agility. as a lame person uses crutches. Both hands and feet are long and narrow, with bent knuckles and short thumbs and toes, so that the palms and soles cannot be pressed flat upon plane surfaces. The face, hands, and feet are naked, and the fur is scanty or thin, though rather long; it is of a brownish-red or Auburn color. Orang-utans live in trees, where they build large nests and feed on fruits and succulent buds or shoots. The strength of the animal is great in proportion to its size, and when brought to bay it proves a formidable antagonist. Also *orang*.

oratorio (or'ā-tō'ri-ō), *n.* [*< It. oratorio*, < LL. *oratorium*, a place of prayer, an oratory or a chapel. The name was originally given to sacred musical works because they were first performed in the oratory of the church of Sta. Maria in Vallicella, under the patronage of Philip Neri: see *oratory*.] 1. A place of worship; a chapel; an oratory.—2. A form of extended musical composition, more or less dramatic in character, based upon a religious (or occasionally a heroic) theme, and intended to be performed without dramatic action and scenery.

The modern oratorio and opera both date from the musical revolution in Italy, about 1600, and were originally indistinguishable from each other, except that one was sacred and the other secular in subject. Both employed the same musical means, such as recitatives, arias, duets, choruses, instrumental accompaniments and passages, and at first even dancing also (for which see *opera*), and both were dramatically presented. But before 1700, particularly in Germany, the oratorio began to be clearly differentiated from the opera, in the relinquishment of dramatic action and accessories, though not usually of dramatic personification, in the more serious and reflective treatment of both arias and choruses, and in the freer use throughout of contrapuntal resources. The oratorio, therefore, came to belong essentially to the class concert music, with more or less of the qualities of church music. The true oratorio style has never been popular in either Italy or France, but has had a remarkable development in both Germany and England. The strong predilection which existed before 1600 for passion-plays led in Germany directly to the cultivation of what is called the *passion-oratorio* or *passion-music*, the theme being the passion and death of Christ, and the whole work being conceived from a decidedly liturgical standpoint. The most famous example of this style is the "Passion according to St. Matthew" of J. S. Bach. In England the works of Handel in the early part of the eighteenth century initiated an interest in the concert oratorio which has been constant and wide-spread. The method of treatment of the English oratorio has varied considerably, from the epic and contemplative to the representative and dramatic, with more or less of the lyrical intermingled. While the oratorio style in general has seldom attained to the passionate intensity and complexity of the opera, it has outstripped the latter in the expression of the lofty spiritual emotions connected with religious thought. Its independence of theatrical limitations has made possible a far more free and elaborate handling of the chorus as a separate artistic means, so that most oratorios are essentially choral works. The oratorio has never occupied the same position of social importance as the opera, but it has perhaps contributed more to the world's store of new artistic conceptions.

Track; course; path, especially a path, as that in a circle or an ellipse, which returns into itself; specifically, in *astron.*, the path of a planet or comet: the curve-line which a planet describes in its periodical revolution round its central body or center of revolution: as, the orbit of Jupiter or Mercury. The orbits of the planets are elliptical, having the sun in one of the foci; and they all move in these ellipses by this law—that a straight line drawn from the center of the sun to the center of any one of them, termed the *radius vector*, always describes equal areas in equal times. Also, the squares of the times of the planetary revolutions are as the cubes of their mean distances from the sun. These are called *Kepler's laws* (see *law*¹). The attractions of the planets for one another slightly derange these laws, and cause the orbits to undergo various changes. The satellites, too, move in elliptical orbits, having their respective primaries in one of the foci. The parabolic and hyperbolic paths of comets are also called orbits. The elements of an orbit are those quantities by which its position and magnitude for the time are determined, such as the major axis and eccentricity, the longitude of the node and the inclination of the plane to the ecliptic, and the longitude of the perihelion. In the ancient astronomy the orbit of a planet is its eccentric or the deferent of its epicycle.
